Product Information

All-New Impala Delivers Pure American Driving Excellence

DETROIT — Since it was first introduced in 1958, Impala has become more than just a car for millions of Americans: it's a passion. A pure American driving excellence.

Impala was conceived, designed and built using a simple, magic formula: provide a good-looking car with more performance, amenities and value than you might expect, all at a Chevy price, and the rest will follow. And that's the same formula used to bring the all-new 2000 Impala to market.

"Today's sedan buyer expects just one thing — everything. And they want it at a fair price," said Don Parkinson, Impala brand manager. "Impala is the car they need; it's the car they want; it's the car they deserve. That's what Chevrolet and the 'magic formula' are all about."

Parkinson said that Impala is for consumers who are longing for a car they can love again. "They want a car that satisfies the head while appealing to the heart. A car that's a real choice ... not a compromise."

Chevrolet Impala is available in two sedan trim levels: Impala and Impala LS. Parkinson said that customers will notice throughout both models subtle feature overtones from the long Impala heritage, like the styling lines that stretch across the classic's profile.

Total Performance System™

Performance and Chevrolet go hand in hand. That's why Impala offers the Total Performance System™ — a carefully engineered package of components that delivers an impressive combination of solid structure, excellent engine power, fuel efficiency and ride and handling.

"The new Impala lives up to its performance legacy in a way that's right for today. It's a balanced approach that says huge fuel economy penalties don't necessarily accompany great powertrain performance," said Greg Bellopatrick, Impala chief engineer. "It proves that a roomy, six-passenger sedan can also be very agile. And it's a testament that superb brake performance is no longer the sole property of the Europeans. This Impala is a totally new breed."

Impala's standard engine is the proven 3400 SFI V6. This engine offers impressive horsepower and torque and, based on preliminary internal tests, is the most fuel-efficient V6 engine in the midsize car segment. GM's award-winning 3800 V6 is the uplevel engine choice and is one of the segment's most fuel efficient engines with 200 horsepower.

The foundation of the Impala centers around a stiffened chassis and unique extruded aluminum engine cradle. This feature provides an added measure of strength and stiffness to the chassis, in addition to the numerous structural enhancements found throughout the vehicle.

The brake system used on Impala was designed to provide excellent pedal feel, consistent performance (regardless of speed or temperature), low pulsation, excellent rotor wear, long component life and minimized noise. Both Impala Sedan and Impala LS come standard equipped with 4-wheel disc brakes. Antilock brakes (ABS) comes standard on LS and is optional on Impala Sedan.

Unparalleled Comfort and Amenities for the Price

Every so often, a car comes along that defies traditional size classifications to offer customers something new, something better. The new Impala is just that car, and it offers unparalleled comfort and amenities in a Chevrolet at a Chevrolet price.

Impala's unique RoomFirst™ interior design maximizes overall roominess, providing true six-passenger comfort. Interior space equals 104.5 cubic feet, exceeding the 102.0 cubic feet of the Lexus LS 400.

Impala offers an incredible amount of standard comfort, convenience and security features. A few include:

- Air conditioning
- PASSiock® theft-deterrent system
- Power door locks with lockout protection
- Power windows with driver's Express-Down and power window lockout
- Electric rear window defogger
- Remote power trunk opener
- Two front cup holders (two in rear seat armrest on LS)
- Front and rear power outlets
- Solar-Ray glass

About Impala's new and unmistakable styling, John Cafaro, Chevrolet chief exterior designer, said the design team set out to develop a style unlike any other sedan. "We wanted Impala to not simply be a happy, friendly Chevy sedan," said Cafaro. "We wanted the car to have just a little more flair to it. A bit more aggressive styling."

Impala's aerodynamic profile was developed over more than 500 hours in the wind tunnel. The result: a low .31coefficient of drag. This low coefficient of drag contributes to Impala's overall fuel efficiency. EPA fuel estimates for the 3400 V6 are 20 MPG city and 32 highway. EPA estimates for the 3800 V6 are 20 MPG city, 29 highway.

Comprehensive Safety Package

"When you compare Impala's list of safety features, then consider its handling and braking prowess and the reliability of its electrical system," said Gary White, vehicle line executive, "it's hard to beat Impala's comprehensive approach to safety and security."

Impala's comprehensive Safety Package of crash avoidance, occupant protection and personal security features include:

- Driver and right front-passenger air bags*
- Optional antilock brakes on Impala Sedan, standard on LS
- Four-wheel disc brakes
- Daytime Running Lamps (DRL)
- Automatic Exterior Headlamp Control
- Rear-seat center shoulder safety belt
- Optional tire inflation monitoring on Impala Sedan, standard on LS
- Optional all-speed Traction Control on Impala Sedan, standard on LS
- Child interior trunk release system (optional on both Impala models)
- 16-inch wheels and tires
- Radio Data System (RDS) that can interrupt radio programming, cassette or compact disc listening so important traffic or weather updates are not missed.

The 2000 Impala meets year 2003 government standards for enhanced head-impact protection. Advances in side-impact protection include a driver side-impact air bag (optional on Impala Sedan, standard on LS) that enhances protection to the driver in the event of a side impact. To help absorb the forces generated from a side-impact collision, high-strength steel side door beams are used to augment the side-impact air bag. In the A-pillars and headliner, engineers designed and placed energy-absorbing foam to assist in reducing head injuries.

QRD Features that Matter the Most to Owners

The customer's interpretation of vehicle quality is a feeling. It's the sense of security the customer gets upon hearing the solid "thud" of a closing door. To Impala engineers, it is the scientific pursuit to design, engineer and build as near perfect a product as possible through QRD (quality, reliability and durability) measurements.

"By every measure of quality, both the scientific and the subjective," said Greg Bellopatrick, "we intend to lead."

That's why every element of Impala's structure, every design cue, the operation of the most minute controls, even the closing sound of doors have been designed to exacting standards.

By employing these standards, Impala has compiled a number of features that reduce long-term maintenance costs to the consumer and provide a more overall satisfactory ownership experience. They include:

- Battery rundown protection
- Powertrains are protected by coolant loss protection, also known as "limp-home" mode.
- Extended-life engine coolant that doesn't need changing for 5 years or 150,000 miles (whichever comes first)†
- First tune-up scheduled at 100,000 miles†
- Brake linings expected to last 40 percent longer than previous systems
- Oil-life monitor (not available on Impala's competition) extends recommended oil change intervals to as much as 7,500 miles†

These features add up to preserve and maintain a healthy vehicle for years to come, long after the last payment is made.

For those who dream of a vehicle that helps them escape the image of driving a "family car," Impala offers them an exciting driving sedan. It comes equipped with comprehensive performance, convenience, comfort and safety features, with impressive design and engineering fervor for world class quality.

- * Always use safety belts and proper child restraints even with air bags. Children are safer when properly secured in a rear seat. Front-seat side-impact air bags help to reduce the risk of certain injuries to front-seat occupants in side impacts. See the owner's manual for more safety information.
- † Maintenance needs vary with different uses and driving conditions. See the owner's manual for more information.

What's New

The Impala and Impala LS

This Impala nameplate is back for 2000 offering two models chock-full of features that make Impala better than ever. Here are only a few:

Interior

- Six-passenger seating (5 in Impala LS)
- Rear theater seating
- Redesigned HVAC systems.

Exterior

- Daytime Running Lamps (DRL) with Automatic Exterior Lamp Control
- Two-sided galvanized steel body panels (except the roof).

Safety And Security

- Driver and right-front passenger air bags*
- Child security rear-door locks.

Brakes

- Power assisted 4-wheel disc brakes (standard on LS, optional on Impala Sedan)
- ABS system.

Highlights

Proven Performance

The 3400 V6 and 3800 Series II V6 are time-proven powertrains that perform with excellent fuel economy.

Comfort and Amenities

Impala's RoomFirst™ interior design maximizes overall roominess, providing true six-passenger comfort (5 in Impala LS).

Comprehensive Safety Package

A driver side-impact air bag† is only one of the many safety features offered on Impala.

Quality and Durability

The exhaust system is constructed of stainless steel and the muffler is aluminized for lasting durability and easy ownership.

Model Summary

- Impala Sedan
- Impala LS

Marketplace

Chevrolet Impala is all-new for 2000 and assumes the role as the Chevrolet car flagship model. Impala is a name with a rich heritage that embodies the heart and soul of a great Chevrolet. Quite simply, it was built on a philosophy called the "magic formula" pioneered by Ed Cole, Chevrolet's Chief Engineer in the late '50s:provide a good-looking car with more performance, amenities, and value than you might expect, all at a Chevrolet price, and the rest will follow. The 2000 Impala revisits that magic formula.

Competitors:

- Ford Taurus
- Dodge Intrepid
- Toyota Avalon.

Vehicle Overview

Interior Overview

Key Standard Features*

Impala Sedan:

- Driver and right-front passenger air bags†
- PASSlock® theft-deterrent system
- Air conditioning with CFC-free refrigerant
- Power windows with driver's Express-Down and power lockout
- Power door locks
- Instrument cluster with speedometer, temperature, and fuel gauge
- Tilt-Wheel™ steering column
- ETR AM/FM stereo with seek-scan, digital clock and four extended-range speakers
- Child security rear-door locks
- Intermittent windshield wiper system
- Rear-seat heat ducts
- Delayed entry/exit interior lighting with theatre dimming
- Rear-seat shoulder belt comfort guides (outboard positions)
- Rear-seat center shoulder lap and safety belt
- Solar-Ray tinted glass
- Two front armrest cup holders
- Carpeted front and rear floor mats
- Courtesy lighting glove box, trunk, theatre dimming dome lamp
- Cloth 60/40 front seat with driver/passenger manual recline, front seatback storage pockets and fixed-back rear seat
- Electric rear window defogger
- Dual outside power remote mirrors.

Impala LS Adds The Following Standard Features In Addition To Or Replacing Impala Sedan Standard Features:

- Driver side-impact air bag helps reduce the risk of certain injuries to front-seat occupants in side impacts**
- Driver and front-passenger temperature controls
- Cabin air filtration system
- Leather-wrapped steering wheel
- Overhead storage console
- Instrument cluster with speedometer, tachometer, temperatureand fuel gauge
- Cruise control with resume and accelerate features
- Luggage area cargo net
- ETR AM/FM stereo with seek-scan, digital clock, TheftLock, speed-compensated volume, cassette, auto tone control, Radio Data System (RDS) and six speakers
- Sport Cloth front bucket seats with storage armrest, front seatback storage pockets, driver manual lumbar, 6-way power driver seat, and split-folding rear seat with armrest and two cup holders
- Driver and passenger covered and illuminated visor vanity mirrors with extenders
- Dual outside power remote heated mirrors
- Courtesy lamps and assist grips
- Two rear armrest cup holders
- Foglamps
- Rear decklid spoiler.

- See Feature Availability chart on page 9 for more features.
- † Always use safety belts and proper child restraints, even with air bags. Children are safer when properly secured in a rear seat. See the owner's manual for more safety information.
- Front-seat, side-impact air bags help reduce the risk of certain injuries to front-seat occupants in side impacts.

Key Optional Features*

- Driver Information Center (trip computer with outside temperature and compass, HomeLink and anti-theft alarm system)
- OnStar Driver Assistance Service helps provide safety, security, and convenience 24 hours a
 day, seven days a week. With the touch of a button, subscribers can communicate with trained
 OnStar advisors who provide valuable information and meet various assistance needs. These
 services can range from sending emergency roadside help to helping order concert tickets. For
 more information, call (248) 269-1395.
- Electric sliding sunroof
- ETR AM/FM stereo with compact disc and cassette players, seek-scan, digital clock, TheftLock, speed-compensated volume, auto tone control, Radio Data System (RDS) and performance 8speaker system with auxiliary amplifier.
- * See Feature Availability Chart additional features.

Exterior/Structural Overview

Key Standard Features*

Impala Sedan:

- Daytime Running Lamps (DRL) with Automatic Exterior Lamp Control
- Two-sided galvanized steel body panels (except roof)
- Color-keyed bodyside moldings
- Charcoal rocker panel moldings
- Dual-body, color electric remote mirrors
- Aluminum engine cradle
- MagBeam[™] magnesium instrument panel beam
- One-piece door stamping
- Strut tower brace
- Rigid floor pan structure.

Impala LS Adds The Following Standard Features In Addition To Or Replacing Impala Sedan Standard Features:

- Dual-body color electric remote heated mirrors
- Rear decklid spoiler
- Body-color rocker panel moldings
- Foglamps.

Exterior Colors

Standard basecoat/clearcoat paint on Impala helps resist fading and provides a high gloss shine for long-lasting exterior beauty. The clearcoat system is formulated to help reduce the effects of acid rain and other environmental damage. The paint process builds up five layers of protection on every new Impala. This five-layer process includes:

- 8-stage phosphate rinse
- Electrodeposition (ELPO) coat dip bath primer
- Sprayed-on 2-coat primer
- Two basecoats in body color
- Two coats clearcoat.

Paint Colors

- Galaxy Silver Metallic
- Dark Jade Green Metallic
- Medium Regal Blue Metallic
- Navy Blue Metallic
- Dark Carmine Red Metallic
- Bright White
- Black
- Light Driftwood Metallic
- Medium Auburn Nightmist Metallic
- Torch Red.

Functional Overview

Key Standard Features*

impala Sedan:

- 3400 SFI V6 engine with 180 horsepower
- Electronically-controlled 4-speed automatic overdrive transmission
- Power 4-wheel disc brakes
- Power rack-and-pinion steering
- 4-wheel independent Soft Ride Suspension
- Battery-rundown protection
- 100,000-mile platinum-tip spark plugs†
- 150,000-mile extended-life engine coolant†
- 100,000-mile long-life transmission fluid†
- Low engine oil and coolant level warning lights
- 16" steel wheels with bolt-on wheel cover
- P225/60R-16 blackwall all-season tires.
- Stainless-steel exhaust system with aluminized muffler.

Impala LS Adds The Following Standard Features In Addition To Or Replacing Impala Sedan Standard Features:

- 3800 Series IISFIV6 engine
- Ride and Handling Suspension
- Power 4-wheel disc antilock brake system (ABS)
- Tire pressure monitor
- 16" aluminum wheels
- P225/60R16N blackwall all-season touring tires
- All-speed Electronic Traction Control
- Remote Keyless Entry.

Key Optional Features*

- Antilock braking system (ABS) with tire inflation sensor (optional on Impala Sedan, standard on Impala LS).
- † Maintenance needs vary with different uses and driving conditions. See the owner's manual for more information.

Safety And Security*

Crash Avoidance Features

- Daytime Running Lamps (DRL) with Automatic Exterior Lamp Control
- 4-wheel antilock brake system (ABS) (standard on Impala LS, optional on Impala Sedan)
- Brake/transmission shift interlock
- Center-mounted horn.

Occupant Protection Features

- Driver and right front-passenger air bags†
- Driver side-impact air bag**(standard on Impala LS, optional on Impala Sedan)
- Impala meets 2003 model-year Federal standards for enhanced head-impact protection, thanks, in part, to specially contoured and energy-absorbing interior surfaces
- Front outboard safety belt pretensioners
- Steel safety-cage construction
- Three-point safety belts for all outboard front and all rear-seat occupants
- Adjustable front shoulder belt guides
- Energy-absorbing steering column and instrument panel
- Rear-seat shoulder belt comfort guides (outboard positions).

Security Features

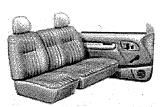

- Child security rear-door locks
- Dual-mode safety belt retractors
- Power window lockout
- Battery-rundown protection
- All-speed Traction Control
- Starter-interrupt feature
- PASSlock® theft-deterrent system
- Remote hood release
- Laser-etched vehicle identification number (VIN).
- * For additional safety information, see the Chevrolet section of this Guide.
- † Maintenance needs vary with different driving uses and driving conditions. See owner's manual for details.
- ** Always use safety belts and proper child restraints, even with air bags. Children are safer when properly secured in a rear seat. See the owner's manual for more safety information.

Seats

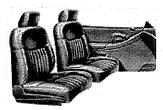

Impala Sedan

Cloth 60/40 split-bench front seat with center storage arm rest and cup holders, front seatback storage pockets, with fixed-back rear seat.

Custom Cloth 60/40 split-bench front seat with center storage armrest and cup holders, front seatback storage pockets, includes six-way power driver seat, driver side-impact air bag*, driver-side manual lumbar control, driver and front-passenger manual recline and split-folding rear seat with armrest and cup holders.

Custom Cloth front bucket seats with center console and storage with cup holders, front seatback storage pockets, includes six-way power driver seat, driver side-impact air bag*, driver-side manual lumbar control, driver and front-passenger manual recline and split-folding rear seat with armrest and cup holders.

Impala LS

Sport Cloth front bucket seats with center console, storage armrest, cup holders, front seatback storage pockets, six-way power driver seat, driver side-impact air bag*, driver-side manual lumbar control, driver and front passenger manual recline, and split-folding rear seat with armrest and cup holders.

Other Options

- Leather seating surfaces available in above seating configurements (Halo head restraints on leather seating for Impala Sedan only.)
- Seating Comfort Pac includes six-way power passenger seat and driver and front passenger heated seats (requires optional leather seating surfaces).

Interior Colors

Cloth Colors:

- Light Oak
- Medium Gray
- Regal Blue (not available on Impala LS).

Leather Seating Surface Colors:

- Light Oak
- Medium Gray.
- Always use safety belts and proper child restraints, even with air bags. Children are safer when properly secured in a rear seat. Front-seat, side impact air bags help reduce the risk of certain injuries to front-seat occupants in side impacts. See owner's manual for more safety information.

Sound Systems

Impala Sedan

Standard

• ETR AM/FM stereo with seek-scan, digital clock and extended speakers.

Optional

- ETR AM/FM stereo with cassette player, seek-scan, digital clock, TheftLock, speed-compensated volume, auto tone control, Radio Data System (RDS), and 6 speakers
- ETR AM/FM stereo with compact disc player, seek-scan, digital clock, TheftLock, speed-compensated volume, auto tone control, Radio Data System (RDS) with performance 8-speaker system and auxiliary amplifier
- ETR AM/FM stereo with compact disc and cassette players, seek-scan, digital clock, TheftLock, speed-compensated volume, auto tone control, Radio Data System (RDS) with performance 8speaker system with auxiliary amplifier.

Impala LS

Standard

 ETR AM/FM stereo with seek-scan, digital clock, TheftLock, speed-compensated volume, cassette, auto tone control, Radio Data System (RDS) and 6 speakers.

Optional

- ETR AM/FM stereo with compact disc and cassette, seek-scan, digital clock, TheftLock, speed-compensated volume, auto tone control, Radio Data System (RDS) with performance 8-speaker system with auxiliary amplifier
- ETR AM/FM stereo with seek-scan, digital clock, TheftLock, speed-compensated volume, cassette, compact disc, auto tone control, Radio Data System (RDS) with performance 8-speaker system with auxiliary amplifier.

Power And Performance

Engineering

Manufacturing Features

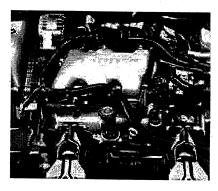

The Impala was conceived as more of a full-size car, but built on a mid-size car platform. Designers embraced what was called the RoomFirst™ approach, which maximizes overall roominess, providing true six-passenger comfort (five-passenger in Impala LS). Engineering teams designing both the interior and exterior worked together so compromises on any vehicle area did not have to be made. Exterior design is clean and contemporary and influenced by Impala models of the past with round taillamps, Chevrolet emblems and sharply sculpted lines.

Also adding to the unique design of the new Impala are:

- The human factors team designed key interior components to achieve an identifiable family image. The Impala and Monte Carlo are the first vehicles to incorporate this theme.
- Considerable research and attention was given to the integration of interior switch gear relative to
 the operation of each component. Details such as gauge needle color, the angle of the door lock
 button, how the switches feel when operated, the amount of resistance they offer to the touch,
 and the distance they travel before actuating were taken into consideration to offer a pleasing,
 seamless, and consistent operation regardless of what button or switch it was.
- Steering wheel design is all-new for Impala and features a two-spoke design.

Engines

3400 V6 SFI Engine (LA1)

Impala Sedan is equipped with a standard 60-degree 3400 V6 engine with Sequential Fuel Injection (SFI) that has been used successfully in a number of GM applications for several years and represents a much improved power increase from the previous 3100 V6 used in the Lumina.

LEV Compliant:

The 3400 V6 SFI engine complies with government LEV requirements.

Power Ratings For The 3400 V6 Are:

- 180 horsepower at 5200 rpm
- 205 lb.-ft. torque at 4000 rpm.

Improvements To The 3400 V6 For 2000 Include:

- Sealed bearings for accessory drive tensioner
- Improved water pump seal
- Improved thermostat

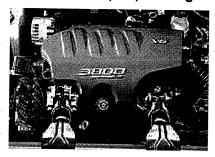

2000 Chevrolet Impala Restoration Kit

- Quiet camshaft drive system
- Low-tension piston rings
- Oil-life monitor.

3400 V6 Sfi Technical Features Include:

- Roller rocker arms
- Air injection reactor (AIR) pump
- "Limp home mode"
- Multec II fuel injectors
- Tuned throttle body
- "Change Oil Soon" indicator
- Oil level and coolant sensors
- Large volume exhaust.

3800 Series II (SFI) V6 Engine (L36)

The 90-degree 3800 Series II SFI V6 engine is standard in Impala LS and optional in Impala Sedan and meets California's ultra-low emissions (ULEV) requirements for the 2000 model year.

Power Ratings For The 3800 Series II V6 9SFI) Engine Are:

- 200 horsepower at 5200 rpm
- 225 lb.-ft. of torque at 4000 rpm.

3800 Series II V6 SFI Improvements For 2000 Include:

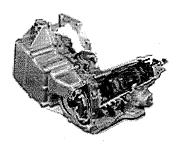

- Air injection reactor (AIR) pump
- "Limp home mode"
- Multec II fuel injectors
- Tuned throttle body
- New one-piece flywheel
- Large volume exhaust.

3800 Series II V6 SFI Technical Features (L36) Include:

- Broad torque band
- Overhead valve (OHV) design
- Symmetrical ports and combustion chambers
- Sequential Fuel Injection
- On-Board Diagnostics Second Generation
- Dual Electronic Spark Control
- Direct accessory mounting
- Laminated oil pan
- "Change Oil Soon" indicator
- Easy and clean oil servicing.

Transmissions

4T65-E 4-Speed Automatic Overdrive Transmission

The 4T65-E 4-speed electronically controlled automatic transmission is designed to handle high performance levels and is standard in both Impala models. Several improvements were made to enhance smoothness of this highly respected transmission.

4T65-E Improvements For The 2000 Model Year Include:

- Improved shifter feel due to changes in the internal detent mechanism
- Shadow port pump system helps eliminate whine noise from the port inside the pump cover by allowing more fluid into the pump.

4T65-E Technical Features Include:

- Electronically-controlled capacity clutch EC3, when engaged, maintains a controlled degree of slippage to help avoid transmitting engine torsional vibrations to the interior of the car at low speeds
- Dual-phase sprocket drives two half-width chains, which rotate 180 degrees out of phase, causing the gear noise generated by each chain to "cancel out" one another
- Family of electronic controls that:
 - Helps protect against over-revving the engine in low-range gears
 - Monitor changes in driving conditions and adjust shift quality, when necessary, for overall smooth shifting.

Gear Ratios For The 4T65-E Are As Follows:

1st			2.921:1
2nd		* - * a	1.568:1
3rd			1.00:1
4th			0.705:1
Rev			2 385.1

Transaxle Final Drive Axle Ratio:

3400 V6:		2:86
3800 V6:		3:05.

Suspension

Impala Sedan features a standard 4-wheel independent Soft Ride Suspension, which is specifically tuned to help provide a more compliant, isolated ride. The goal was to maintain the nimble feel of Impala regardless of the model. The tires chosen for this setup, P225/60R16, are a cross between traction, cornering, rolling resistance, and softness.

Soft Ride Suspension Technical Features Include:

- Hollow 32mm front and solid 14mm rear stabilizer bar
- Non-linear rear springs.

For a more performance-oriented feel, Impala LS models feature a Ride and Handling Suspension as standard equipment. This suspension is designed to accommodate higher performance driving. The tire chosen for this setup, a performance tire, combines a greater degree of handling characteristics.

Ride And Handling Suspension Technical Features Include:

- Hollow 30mm front and solid 17.2mm rear
- Non-linear rear springs.

Steering

To help achieve precise control in demanding driving conditions, power-assisted rack-and-pinion steering is standard on all Impala models.

- 15.2:1 steering ratio is standard on Impala Sedan
- 14.1:1 steering ratio is standard on Impala LS.

Brakes

Impala Sedan and LS models have standard power-assisted 4-wheel disc brakes.

The goal of engineers when designing the brake system for Impala was to provide superior pedal feel, consistent performance regardless of speed or temperature, and long-lasting components over the life of the brakes, not just when they're new. As a result, Impala features brake hardware that is among the largest in the industry. Key elements of this brake system include:

- Standard power-assisted 4-wheel disc brakes
- Large rotors that provide a larger surface area which aids in the dissipation of heat
- More efficient booster with less brake pedal force required, a smaller brake booster can also be used, saving over 2 lbs. of weight and improving underhood packaging. A smaller booster also improves the braking system's response times.

GM's ABS system is standard on Impala LS and optional on Impala Sedan. This new ABSsystem is solenoid controlled, which permits the use of ABS as a stand alone or allows ABS to be paired with Traction Control, all in one unit, eliminating the need for a second add-on unit. This solenoid-based system is also smaller and weighs less than traditional ABS systems with electric motors and throttling orifices.

Wheels And Tires

Wheels

16" steel wheel with bolt-on wheel cover standard on Impala Sedan.

16" custom aluminum wheel optional on Impala Sedan.

16" Sport aluminum wheel standard on Impala LS, not available on Impala Sedan.

Tires

- Standard P225/60R-16 blackwall all-season tires (standard on Impala Sedan)
- P225/60R-16 blackwall touring tires (optional on Impala Sedan)
- 16" Sport aluminum wheel and P225/60R-16N blackwall touring tires (standard on Impala LS).

Vehicle Identification

Vehicle Identification Number (VIN)

The vehicle identification number (VIN) plate is the legal identifier of the vehicle. The VIN plate is located on the upper LH corner of the Instrument Panel and can be seen through the windshield from the outside of the vehicle:

Position	Definition	Character	Description
1	Country of Origin	2	Canada
2	Manufacturer	G	General Motors
3	Make	1	Chevrolet
4	Car Line	W	Impala, Monte Carlo
		F	Impala
5	Series	Н	Impala LS
	Series	W	Monte Carlo LS
		X	Monte Carlo SS
	Body Style	4	2 Door Coupe
6			(GM Style 27)
		5	4 Door Sedan
		5	(GM Style 19)
	Restraint System	2	Active (Manual) Belts with
7			Driver and Passenger
•			Supplemental Inflatable
			Restraint
	Engine Type	E	6 Cylinder MFI High
			Output 3400
			(RPO Code LA1)
		K	6 Cylinder MFI High
			Output 3800
			(RPO Code L36)
9	Check Digit		
10	Model Year	Y	2000
11	Plant Location	1	Oshawa #2
		9	Oshawa #1
12-17	Plant Sequence Number		

VIN Derivative

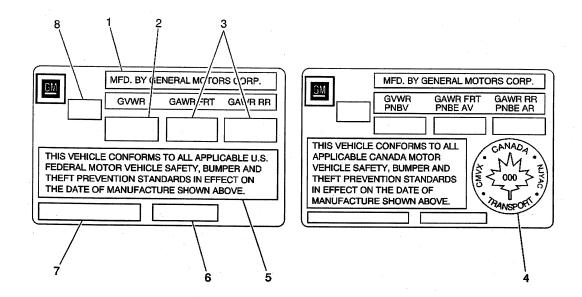

All engines and transmissions are stamped or laser etched with a partial vehicle identification number (VIN), which was derived from the complete VIN. A VIN derivative contains the following nine positions:

Position	Definition	Character	Description
1	GM Division Identifier	1	Chevrolet
2	Model Year	Υ	2000
3 Assembly Plant	1	Oshawa #2	
	9	Oshawa #1	
4-9	Plant Sequence Number		

A VIN derivative can be used to determine if a vehicle contains the original engine or transmission, by matching the VIN derivative positions to their accompanying positions in the complete VIN:

VIN Derivative Position	Equivalent VIN Position
1	3
2	10
3	.11
4-9	12-17

Vehicle Certification Label

- (1) Name of Manufacturer
- (2) Gross Vehicle Weight-Rating
- (3) Gross Axle Weight-Rating, Front, Rear
- (4) Canadian Safety Mark (w/RPO Z49)
- (5) Certification Statement
- (6) Vehicle Class Type (Pass Car, etc.)
- (7) Vehicle Identification Number
- (8) Date of Manufacture (Mo/Yr)

The vehicle certification label is permanently located on the edge of the driver's door. Refer to this label in order to obtain the following information:

- The Gross Vehicle Weight Rating (GVWR)
- The Gross Axle Weight Rating (GAWR), front and rear

The Gross Vehicle Weight (GVW) must not exceed the Gross Vehicle Weight Rating (GVWR).

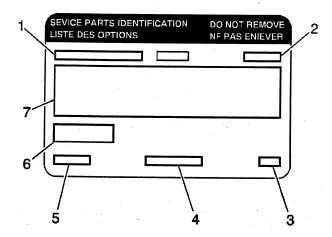

The GVW is the weight of the vehicle and everything the vehicle carries. Include the following items when figuring the GVW:

- The base vehicle weight (factory weight)
- The weight of any added vehicle accessories
- The weight of the driver and the passenger
- The weight of any cargo being carried

The front and rear Gross Axle Weights (GAW) must not exceed the Gross Axle Weight Ratings (GAWR), front and rear

The GAW is the weight exerted on one of the axles (front or rear).

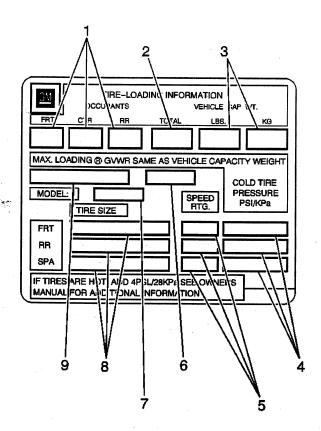

Service Parts Identification Label (SPID)

- (1) Vehicle Identification Number
- (2) Engineering Model Number (Vehicle Division, Vehicle Line and Body Style)
- (3) Interior Trim and Decor Level
- (4) Exterior (Paint Color) WA Number
- (5) Paint Technology
- (6) Special Order Paint Colors and Numbers
- (7) Vehicle Option Content

The service parts identification label is used to identify the original equipment options built into the specific vehicle being serviced. The option content of a vehicle is very important information to properly service the vehicle.

Tire Placard

- (1) Specified Occupant Seating Positions
- (2) Total Occupant Seating
- (3) Maximum Vehicle Capacity Weight
- (4) Tire Pressures, Front, Rear, and Spare
- (5) Tire Speed Rating, Front, Rear, and Spare
- (6) Tire Label Code
- (7) Engineering Model Minus First Character
- (8) Tire Sizes, Front, Rear, and Spare
- (9) Vehicle Identification Number

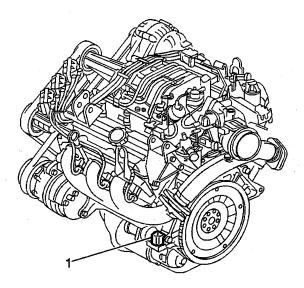

The Tire Placard is permanently located on the edge of the driver's door. Refer to the placard to obtain:

- The maximum vehicle capacity weight
- The cold tire inflation pressures
- The tire sizes (original equipment tires)
- The tire speed ratings (original equipment tires)

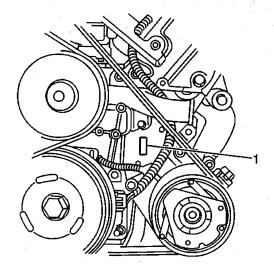

Engine ID and VIN Derivative Location

The eighth character in the Vehicle Identification Number (VIN) identifies the engine. Adhesive-backed labels attached to the engine, laser etching or stampings on the engine block indicate the engine unit number/date code. All engines are stamped with a VIN derivative. For more information on the VIN derivative, refer to VIN Derivative above.

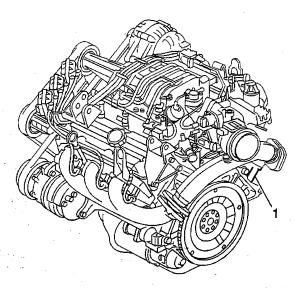

3.8L Engine VIN Derivative Location(c)

The primary location (1) of the VIN derivative for the 3800 L36 engine is on the engine block above the starter motor.

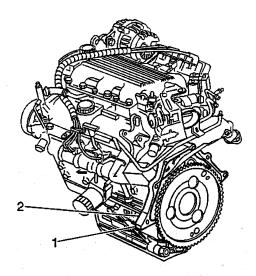

The secondary location (1) of the VIN derivative for the 3800 L36 engine is on the engine block below the water pump.

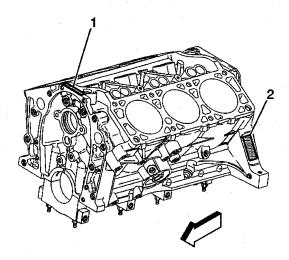

The primary location (1) of the Engine ID for the 3800 L36 engine is in the center of the LH rocker arm or LH side of the engine in the oil pan rail area of the engine.

3400 VIN E Engine

The primary (1) and optional (2) location of the VIN derivative for the 3400 LA1 engine is on the lower left front transaxle mounting surface.

The eighth digit of the Vehicle Identification Number (VIN) identifies the engine. The adhesive-backed labels attached to the engine, laser etching or stampings on the engine block indicate the engine unit number/date code. All engines are stamped with a VIN derivative.

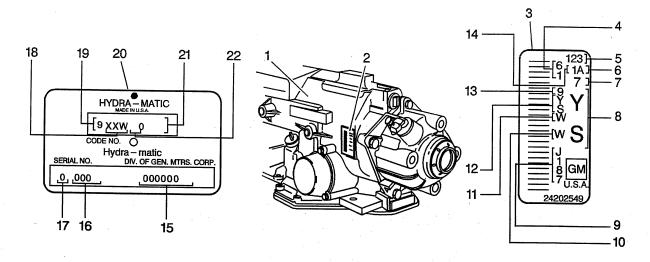

The primary location (1) of the Engine ID for the 3400 (LA1) engine on top of the RH rocker arm cover or front of RH oil pan rail. The secondary location (2) of the VIN derivative for the 3400 (LA1) engine is above the starter motor on the engine block. For additional information, refer to VIN Derivative above.

Engine and Transmission Usage

- (17) W = Warren Assembly Plant
- (18) 4T65-E
- (19) Model
- (20) Vehicle Identification Number (VIN) Derivative Stamping Location

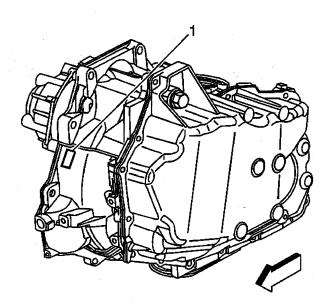

All automatic transmissions have a metal identification (ID) nameplate (9) attached to the case exterior.

Transmission VIN Location 4T65-E, M15/MN3/MN7(c)

The primary (1) and secondary (2) Manual Tooling VIN Derivative Locations are on the casting of the transmission housing.

Transaxle VIN Derivative Stamping(c)

The location for the Semi-Automatic VIN derivative (1) is on the transmission housing.

Labeling - Anti-Theft

Notice

The anti-theft label found on some major body panels MUST be covered before performing any painting, rustproofing or undercoating procedures. The mask must also be removed following those procedures. Failure to follow these precautionary steps may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

Federal law requires General Motors (GM) to affix a label to certain parts on selected vehicles with the Vehicle Identification Number (VIN). The purpose of this law is to reduce the number of motor vehicle thefts by helping in the tracing and recovery of parts from stolen vehicles. The certification label on the driver's door qualifies as a theft deterrent label.

The theft deterrent label will be permanently affixed to an interior surface of the part and will contain the complete VIN. The label on replacement parts will contain the letter R, the manufacturer's logo, and the acronym for the Department of Transportation (DOT). DO NOT deface, or remove these labels.

RPO Code List

The production/process codes provide the description of the Regular Production Options (RPOs) used on the vehicle. The RPO list is printed on the Service Parts Identification Label. The following is a list of the RPO abbreviations and the description of each:

RPO	Description
AG1	Adjuster Front Seat Power
AG2	Adjuster Seat, Power, 6-Way, Lumbar 4 Way, Driver
AK5	Restraint System, Front Seat Inflatable Driver and Passenger
AM6	Seat, Front Split Bench
AM9	Seat Right Rear Split Back, Folding
AN4	Restraint Provisions Child
AP9	Net Convenience
AR9	Seat, Front Bucket Deluxe
AU0	Lock Control, Remote Entry
AW6	Restraint System Seat, Inflatable, Driver and Pass FR, Inflatable Driver Side
A75	Seat Cushion Back Front, HD
A76	Seat Cushion Back Rear, HD
A90	Lock Control, Rear Compartment Lid Remote Control Electric Release
A98	Ignition Powered Trunk Release

Fluid and Lubricant Recommendations

Usage	Fluid/Lubricant
Automatic Transaxle	DEXRON®-III Automatic Transaxle Fluid
Engine Oil	Engine oil with the American Petroleum Institute Certified For Gasoline Engines Starburst symbol of the proper viscosity.
Engine Oil (Export)	In areas of the world other than North America, it may be difficult to find oils that display the API STARBURST, look for oils that meet the API Service SJ and ACEA requirements.
Engine Coolant	50/50 mixture of clean, drinkable water and GM Goodwrench® DEX-COOL® or Havoline® DEX-COOL® (silicate-free) coolant
Hood and Door Hinges	Multi-Purpose Lubricant, Superlube® (GM P/N 12346241 or equivalent)
Hood Latch Assembly,	Lubriplate® Lubricant Aerosol (GM P/N 12346293 or equivalent) or
Anchor and Release Pawl	lubricant meeting requirements of NLGI #2 Cataegory LB or GC-LB
Hydraulic Brake System	Delco Supreme 11® Brake Fluid (GM P/N 12377967 or equivalent DOT-3 brake fluid)
Key Lock Cylinders	Multi-Purpose Lubricant, Superlube® (GM P/N 12346241 or equivalent)
Power Steering System	GM Power Steering Fluid (GM P/N 1052884 - 1 pint or 1050017 - 1 quart, or equivalent)
Weatherstrip Conditioning	Dielectric Silicone Grease (GM P/N 12345579 or equivalent)
	GM Optikleen ® Washer Solvent (GM Part No. 1051515) or equivalent.

Descriptions and Operations

Power Steering System Description

Power Steering Pump Description

The power steering pump is a vane-type pump which provides hydraulic pressure for the system. The power steering system consists of the following components:

- The driveshaft
- The pump housing
- The pump ring
- The pressure plate
- The thrust plate
- The flow control valve
- The rotor
- The vanes

The opening at the rear of the pump housing contains the following components:

- The pump ring
- The pressure plate
- The thrust plate
- The rotor
- The vanes
- The end plate

The small opening on the side of the housing contains the following components:

- The pressure line fitting
- The flow control valve
- The spring

The flow control orifice is a component of the pressure line fitting. A pressure relief valve inside the flow control valve limits the pump pressure.

Power Steering Gear Description

The movement of the steering wheel has the following results:

- 1. The movement of the steering wheel transfers to the pinion.
- 2. The movement of the pinion transfers through the pinion teeth.
- 3. The pinion teeth mesh with the teeth on the rack.
- 4. This action causes the rack to move.

The power rack and pinion steering system has a rotary control valve. The rotary control valve directs the hydraulic fluid that flows from the hydraulic pump to either side of the rack piston.

The integral pick piston attaches to the rack.

The integral rack piston has the following effects:

- 1. The rack piston converts hydraulic pressure to linear force.
- 2. The linear force moves the rack left or right.
- 3. The linear force transmits to the inner and outer tie rods to the steering knuckles.
- The steering knuckles turn the wheels.

The system will require more steering effort if hydraulic assist is not available. If hydraulic assist is not available, the system will maintain manual control.

Steering Wheel and Column - Standard Description and Operation

The steering wheel and column has 4 primary functions:

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

Vehicle Security

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch
- The steering column lock
- The ignition cylinder

Driver Convenience

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on or near the steering wheel or column.

- The turn signal switch
- The hazard switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad/cruise control switch
- The redundant radio/entertainment system controls
- The tilt or tilt/telescoping functions
- The HVAC controls

Driver Safety

The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The mounting capsules break away from the mounting bracket in the event of an accident.

Suspension Description and Operation

Front Suspension

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension allows each wheel to compensate for changes in the road surface without affecting the opposite wheel. Each wheel independently connects to the frame with a steering knuckle, ball joint assemblies, and upper and lower control arms.

The control specifically allow the steering knuckles to move in a three-dimensional arc. Two tie rods connect to steering arms on the knuckles and an intermediate rod. These operate the front wheels.

The rear wheel drive vehicles have coil chassis springs. These springs are mounted between the spring housings on the frame and the lower control arms. Shock absorbers are mounted inside the coil springs. The coil springs attach to the lower control arms with bolts and nuts.

The upper part of each shock absorber extends through the upper control arm frame bracket, and the shock absorber secures with two grommets, two retainers, and a nut.

A spring stabilizer shaft controls the side roll of the front suspension. This shaft is mounted in rubber insulators that are held by brackets to the frame side rails. The ends of the stabilizer shaft connect to the lower control arms with link bolts. Rubber insulators isolate these link bolts.

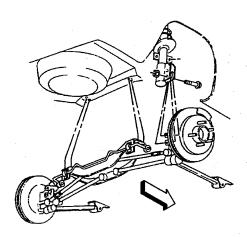

A ball joint assembly is riveted and bolted to the outer end of the upper control arm. A castellated nut and a cotter pin join the steering knuckle to the upper ball joint.

The inner ends of the lower control arm have pressed-in bushings. The bolts pass through the bushings and join the arm to the frame. The lower ball joint assembly is a press fit in the lower control arm and attaches to the steering knuckle with a castellated nut and a cotter pin.

Ball socket assemblies have rubber grease seals. These seals prevent entry of moisture and dirt, and these seals prevent damage to the bearing surfaces.

Rear Suspension

The rear suspension utilizes coil springs over struts and lightweight aluminum knuckles. Each wheel is mounted to a tri-link independent suspension system. The three links are identified as the inverted U channel trailing arm and the tubular front and rear rods.

Parallel links allow the rear wheels to reflect upward when the rear wheels hit a road hazard, without moving the toe angle in a positive direction. An advantage of this suspension system is the reduction of unsprung and overall weight. Handling is improved with the independent action of each rear wheel. The rods control the lateral wheel deflection.

Several techniques are employed to achieve this independent wheel movement. The tri-link design may be compared to a right angle. The wheel is located at the right angle formed by the rods and the trailing arm. The ends of the tri-links hinge in order to provide vertical wheel travel. The solid links force the wheel to travel through a controlled arc whose fore-aft position is determined by the trailing arm, and whose lateral position is determined by the rods.

Aside from maintaining geometric wheel location, each portion of the suspension has additional functions. The knuckle supports the brake caliper. All brake torque and braking forces are transmitted through the tri-links and the strut. The final duty of the rods is to maintain the camber angle of the wheel throughout the wheel's travel, and to allow for setting the toe. The overall result of this rear suspension geometry is to maintain the rear wheels in a near vertical position at all times.

The stabilizer shaft attaches to the stabilizer bar drop link and extends rearward, where the stabilizer connects to the rear suspension support by two rubber bushings and mounting brackets.

A non-serviceable unit hub and bearing bolts to the knuckle. This hub and bearing is a sealed, maintenance-free unit.

Check the suspension system periodically for the following conditions:

- Shock absorbency
- Bushing durability
- Tightness of attaching bolts
- Visible damage
- Misalignment
- Excessive wear

Wheels and Tires

General Description

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

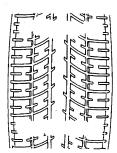

The following factors have an important influence on tire life:

- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

Tread Wear Indicators Description

The original equipment tires have tread wear indicators that show when you should replace the tires.

The location of these indicators are at 72 degree intervals around the outer diameter of the tire. The indicators appear as a 6 mm (0.25 in) wide band when the tire tread depth becomes 1.6 mm (2/32 in).

Metric Wheel Nuts and Bolts Description

Metric wheel/nuts and bolts are identified in the following way:

- The wheel/nut has the word Metric stamped on the face.
- The letter M is stamped on the end of the wheel bolt.

The thread sizes of metric wheel/nuts and the bolts are indicated by the following example: M12 x 1.5.

- M = Metric
- 12 = Diameter in millimeters
- 1.5 = Millimeters gap per thread

Tire Inflation Description

When you inflate the tires to the recommended inflation pressures, the factory-installed wheels and tires are designed in order to handle loads to the tire's rated load capacity. Incorrect tire pressures, or underinflated tires, can cause the following conditions:

- Vehicle handling concerns
- Poor fuel economy
- Shortened tire life
- Tire overloading

Inspect the tire pressure when the following conditions apply:

- The vehicle has been sitting at least 3 hours.
- The vehicle has not been driven for more than 1.6 km (1 mi).
- The tires are cool.

Inspect the tires monthly or before any extended trip. Adjust the tire pressure to the specifications on the tire label. Install the valve caps or the extensions on the valves. The caps or the extensions keep out dust and water.

The kilopascal (kPa) is the metric term for pressure. The tire pressure may be printed in both kilopascal (kPa) and psi. One psi equals 6.9 kPa.

Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
	Conversion: 6	.9 kPa = 1 psi	

Tires with a higher than recommended pressure can cause the following conditions:

2000 Chevrolet Impala Restoration Kit

- A hard ride
- Tire bruising
- Rapid tread wear at the center of the tire

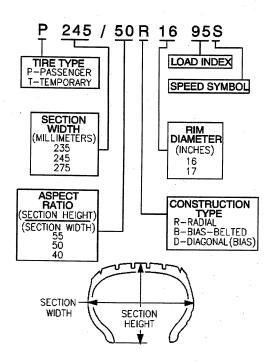

Tires with a lower than recommended pressure can cause the following conditions:

- A tire squeal on turns
- Hard steering
- Rapid wear and uneven wear on the edge of the tread
- Tire rim bruises and tire rim rupture
- Tire cord breakage
- High tire temperatures
- Reduced vehicle handling
- High fuel consumption
- Soft riding

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking
- Steering lead
- Reduced vehicle handling

P-Metric Sized Tires Description

Most P-metric tire sizes do not have exact corresponding alphanumeric tire sizes. Replacement tires should be of the same tire performance criteria (TPC) specification number including the same size, the same load range, and the same construction as those originally installed on the vehicle. Consult a tire dealer if you must replace the P-metric tire with other sizes. Tire companies can best recommend the closest match of alphanumeric to P-metric sizes within their own tire lines.

Tire Inflation Monitoring System Operation

The tire pressure monitor (TPM) system alerts the driver when the pressure changes in one of the tires. The system only detects a low pressure condition while the vehicle is being driven. Once a low tire pressure condition is detected, the system informs the driver whenever the ignition is ON.

The LOW TIRE PRESSURE indicator illuminates if the tire pressure in one or more tires become at least 82 kPa (12 psi) lower or higher than the other tires. The message does not appear if the system is not calibrated properly. The system does not inform the driver which tire is low. To clear this message, set the tire pressures in all four tires to the proper pressures and perform the system reset procedure

The Tire Pressure Monitor software requires approximately one half hour of straight line driving to complete the TPM autolearn. There are several speed ranges that the EBCM needs to learn the tire inflation configuration in order to have the full capability of detecting a low tire condition. The speed detection ranges are the following:

- 24-64 km/h (15-40 mph)
- 64-113 km/h (40-70 mph)
- 113-145 km/h (70-90 mph)

Each speed range has 2 modes of low tire detection.

- Monitor Mode 1
- Monitor Mode 2

The EBCM learns the tire inflation configuration for each speed range independently. In Monitor Mode 1, the EBCM has only partially learned the tire inflation configuration for the speed range and has limited detection capability for a low tire condition. In Monitor Mode 2, the EBCM has fully learned the tire inflation configuration for the speed range and has full detection capability for a low tire condition. If the EBCM is not in Monitor Mode 1 or Monitor Mode 2, a low tire condition cannot be detected because the EBCM has not learned the tire inflation configuration of the vehicle.

Driveline System Description and Operation

Wheel Drive Shafts

Front wheel drive axles are flexible assemblies.

Front wheel drive axles consist of the following components:

- A front wheel drive shaft tri-pot joint (inner joint)
- A front wheel drive shaft constant velocity joint (outer joint)
- A front wheel drive shaft The front wheel drive shaft connects the front wheel drive shaft tri-pot
 joint and the front wheel drive shaft constant velocity joint.

The front wheel drive shaft tri-pot joint is completely flexible. The front wheel drive shaft tri-pot joint can move in and out.

The front wheel drive shaft constant velocity joint is flexible, but the front wheel drive shaft constant velocity joint cannot move in and out.

Boots (Seals) And Clamps

The front wheel drive shaft constant velocity joint and the front wheel drive shaft tri-pot joint boots (seals) in the front wheel drive axle are made of a thermoplastic material.

The clamps in front wheel drive axle are made of stainless steel.

The boot (seal) provides the following functions:

- Protection of the internal parts of the front wheel drive shaft constant velocity joint and the front wheel drive shaft tri-pot joint. The boot (seal) protects the grease from the following sources of damage:
 - Harmful atmospheric conditions (such as extreme temperatures or ozone gas)
 - Foreign material (such as dirt or water)
- Allows angular movement and the axial movement of the front wheel drive shaft tri-pot joint.
- Allows angular movement of the front wheel drive shaft constant velocity joint.

Important

Protect the boots (seals) from sharp tools and from the sharp edges of the surrounding components.

Any damage to the boots (seals) or the clamps will result in leakage. Leakage will allow water to leak into the front wheel drive shaft tri-pot joints and the front wheel drive shaft constant velocity joints. Leakage will also allow grease to leak out of the front wheel drive shaft tri-pot joints and the front wheel drive shaft constant velocity joints.

Leakage may cause noisy front wheel drive axle operation and eventual failure of the internal components.

The clamps provide a leak proof connection for the front wheel drive shaft tri-pot joint and the front wheel drive shaft constant velocity joint at the following locations:

- The housing
- The front wheel drive shaft

The thermoplastic material performs well under normal conditions and normal operation. However, the material is not strong enough to withstand the following conditions:

- Abusive handling
- Damage from sharp objects (such as sharp tools or any sharp edges of the surrounding components in the vehicle).

Front Wheel Drive Shaft Tri-pot Joint (Inner Joint)

The front wheel drive shaft tri-pot joint is made with the tri-pot design without an over-extension limitation retainer.

The joint is constructed as follows for vehicles that are equipped with an automatic transmission:

- The left front wheel drive axle has a female spline. The female spline installs over a stub shaft that protrudes from the transaxle.
- The right front wheel drive axle has a male spline. The right front wheel drive axle uses barrel type snap rings in order to interlock with the transaxle gears.

Front Wheel Drive Shaft Constant Velocity Joint (Outer Joint)

The front wheel drive shaft constant velocity joint is made with the Rzeppa joint design.

The shaft end (which mates with the knuckle/hub) has a helical spline. The helical spline ensures a tight, press-type fit.

This design prevents end play between the hub bearing and the front wheel drive axle.

Braking System Description and Operation

Hydraulic Brake System Description and Operation

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir

Contains supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder

Converts mechanical input force into hydraulic output pressure.

Hydraulic output pressure is distributed from the master cylinder through two hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force.

Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator.

Hydraulic Brake Pipes and Flexible Brake Hoses

Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components

Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

Brake Assist System Description and Operation

System Component Description

The brake assist system consists of the following:

Brake Pedal

Receives, multiplies and transfers brake system input force from driver.

Brake Pedal Pushrod

Transfers multiplied input force received from brake pedal to brake booster.

Vacuum Brake Booster

Uses source vacuum to decrease effort required by driver when applying brake system input force.

When brake system input force is applied, air at atmospheric pressure is admitted to the rear of both vacuum diaphragms, providing a decrease in brake pedal effort required. When input force is removed, vacuum replaces atmospheric pressure within the booster.

Vacuum Source

Supplies force used by vacuum brake booster to decrease brake pedal effort.

Vacuum Source Delivery System

Enables delivery and retention of source vacuum for vacuum brake booster.

System Operation

Brake system input force is multiplied by the brake pedal and transferred by the pedal pushrod to the hydraulic brake master cylinder. Effort required to apply the brake system is reduced by the vacuum brake booster.

Disc Brake System Description and Operation

System Component Description

The disc brake system consists of the following components:

Disc Brake Pads

Applies mechanical output force from the hydraulic brake calipers to friction surfaces of brake rotors.

Disc Brake Rotors

Uses mechanical output force applied to friction surfaces from the disc brake pads to slow speed of tire and wheel assembly rotation.

Disc Brake Pad Hardware

Secures disc brake pads firmly in proper relationship to the hydraulic brake calipers. Enables a sliding motion of brake pads when mechanical output force is applied.

Disc Brake Caliper Hardware

Provides mounting for hydraulic brake caliper and secures the caliper firmly in proper relationship to caliper bracket. Enables a sliding motion of the brake caliper to the brake pads when mechanical output force is applied.

System Operation

Mechanical output force is applied from the hydraulic brake caliper pistons to the inner brake pads. As the pistons press the inner brake pads outward, the caliper housings draw the outer brake pads inward. This allows the output force to be equally distributed. The brake pads apply the output force to the friction surfaces on both sides of the brake rotors, which slows the rotation of the tire and wheel assemblies. The correct function of both the brake pad and brake caliper hardware is essential for even distribution of braking force.

Drum Brake System Description and Operation

System Component Description

The drum brake system consists of the following:

Drum Brake Shoes

Applies mechanical output force (from hydraulic brake wheel cylinders) to friction surface of brake drums.

Brake Drums

Uses mechanical output force applied to friction surface from drum brake shoes to slow speed of tire and wheel assembly rotation.

Drum Brake Hardware

Secures drum brake shoes firmly in proper relationship to hydraulic brake wheel cylinders. Enables sliding motion of brake shoes needed to expand toward friction surface of drums when mechanical output force is applied; provides return of brake shoes when mechanical output force is relieved.

Drum Brake Adjusting Hardware

Provides automatic adjustment of brake shoes to brake drum friction surface whenever brake apply occurs during rearward motion of the vehicle.

System Operation

Mechanical output force is applied from the hydraulic brake wheel cylinder pistons to the top of the drum brake shoes. The output force is then distributed between the primary and secondary brake shoes as the shoes expand toward the friction surface of the brake drums. The brake shoes apply the output force to the friction surface of the brake drums, which slows the rotation of the tire and wheel assemblies. The proper function of both the drum brake hardware and adjusting hardware is essential to the proper distribution of braking force.

Park Brake System Description and Operation

System Component Description

The park brake system consists of the following:

Park Brake Lever Assembly

Receives, multiplies, and transfers park brake system apply input force from operator to park brake cable system.

Releases applied park brake system when lever is returned to at-rest, lowered, position.

Park Brake Cables

Transfers input force received from park brake lever, through park brake cable equalizer, to park brake apply levers.

Park Brake Cable Equalizer

Evenly distributes input force to both the left and right park brake units.

Park Brake Apply Lever

Multiplies and transfers input force to park brake actuator/adjuster.

Park Brake Actuator/Adjuster

Uses multiplied input force from apply lever to expand drum brake shoes toward the friction surface of the brake drum.

Threaded park brake actuators/adjusters are also used to control clearance between the drum brake shoes and the friction surface of the brake drum.

Drum Brake Shoes

Applies mechanical output force from park brake actuator/adjuster to friction surface of the brake drum.

System Operation

Park brake apply input force is received by the park brake lever assembly being applied. The input force is multiplied by the lever assembly, transferred, and evenly distributed, through the park brake cables and the park brake cable equalizer, to the left and right park brake apply levers. The park brake apply levers multiply and transfer the apply input force to the park brake actuators/adjusters which expand the drum brake shoes toward the friction surface of the brake drum in order to prevent the rotation of the rear tire and wheel assemblies. The park brake lever assembly releases an applied park brake system when it is returned to the at-rest, lowered, position.

ABS Description and Operation

Antilock Brake System

When wheel slip is detected during a brake application, the ABS enters antilock mode. During antilock braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel brake. The ABS cannot, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking.

During antilock braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the EBCM responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during antilock braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During antilock braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during antilock operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non-ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability.

Engine Component Description

The cylinder block is made of cast alloy iron. The cylinder block has 6 cylinders that are arranged in a V shape. There are 3 cylinders in each bank. The cylinder banks are set at a 60 degree angle from each other.

Starting from the front of the engine, the left bank cylinders are 1, 3, 5. The right bank cylinders are 2, 4, 6.

Four main bearings support the crankshaft. The crankshaft is retained by the bearing caps. The bearing caps are machined with the block for proper alignment and clearances. The main bearing caps are drilled and tapped for the structural oil pan side bolts.

The aluminum cylinder heads have individual intake and exhaust ports for each cylinder. The valve guides are pressed in. The roller rocker arms are located on a pedestal in a slot in the cylinder head. The roller rocker arms are retained on individual threaded bolts.

The crankshaft is cast nodular iron with deep rolled fillets on all 6 crankpins and all 4 main journals. Four steel-backed aluminum bearings are used. The #3 bearing is the end-thrust bearing.

The camshaft is made from a new metal composite design. The camshaft profile is a hydraulic roller design. The camshaft is supported by 4 journals. The camshaft includes an oil pump drive gear.

The pistons are cast aluminum using 2 compression rings and 1 oil control ring. The piston pin is offset 0.8 mm (0.031 in) towards the major thrust side. This placement allows for a gradual change in thrust pressure against the cylinder wall as the piston travels its path. The pins are chromium steel. The pins have a floating fit in the pistons. The pins are retained in the connecting rods by a press fit.

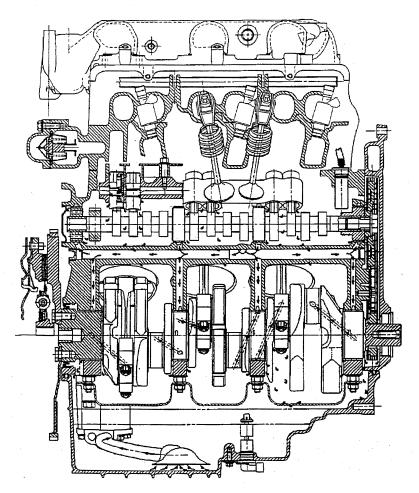

The connecting rods are made of forged steel. Full pressure lubrication is directed to the connecting rods by drilled oil passages from the adjacent main bearing journal.

A roller rocker type valve train is used. Motion is transmitted from the camshaft through the hydraulic roller lifter and from the pushrod to the roller rocker arm. The rocker arm pivots on the needle roller bearings. The rocker arm transmits the camshaft motion to the valve. The rocker arm pedestal is located in a slot in the cylinder head. The rocker arm is retained in the cylinder head by a bolt. The pushrod is located by the rocker arm.

The intake manifold is a 2-piece cast aluminum unit. The intake manifold centrally supports a fuel rail with 6 fuel injectors.

The exhaust manifolds are cast nodular iron.

Lubrication

Full pressure lubrication, through a full flow oil filter, is furnished by a gear type oil pump. The oil is drawn up through the pickup screen and the tube. The oil passes through the pump to the oil filter.

The oil filter is a full flow paper element unit. An oil filter bypass is used in order to ensure oil supply during the following conditions:

- On a cold start
- If the filter is plugged
- If the filter develops excessive pressure drop

The bypass is designed to open at 69-83 kPa (10-12 psi).

A new priority oil delivery system supplies oil first to the crankshaft journals. The oil from the crankshaft main bearings is supplied to the connecting rod bearings by intersecting the passages drilled in the crankshaft. The passages supply the oil to the crankshaft main bearings and the camshaft bearings through the intersecting vertical drilled holes. The oil passages from the camshaft journals supply oil to the hydraulic lifters.

The hydraulic lifters pump oil up through the pushrods to the rocker arms. The cast dams in the crankcase casting direct the oil that drains back from the rocker arms in order to supply the camshaft lobes. The camshaft chain drive is lubricated by indirect oil splash.

Drive Belt System Description

The drive belt system consists of the following components:

- The drive belt
- The drive belt tensioner
- The drive belt idler pulley
- The crankshaft balancer pulley
- The accessory drive component mounting brackets
- The accessory drive components
 - The power steering pump, if belt driven
 - The generator
 - The A/C compressor, if equipped
 - The engine cooling fan, if belt driven
 - The water pump, if belt driven
 - The vacuum pump, if equipped
 - The air compressor, if equipped

The drive belt system may use one belt or two belts. The drive belt is thin so that it can bend backwards and has several ribs to match the grooves in the pulleys. There also may be a V-belt style belt used to drive certain accessory drive components. The drive belts are made of different types of rubbers (chloroprene or EPDM) and have different layers or plys containing either fiber cloth or cords for reinforcement.

Both sides of the drive belt may be used to drive the different accessory drive components. When the back side of the drive belt is used to drive a pulley, the pulley is smooth.

The drive belt is pulled by the crankshaft balancer pulley across the accessory drive component pulleys. The spring loaded drive belt tensioner keeps constant tension on the drive belt to prevent the drive belt from slipping. The drive belt tensioner arm will move when loads are applied to the drive belt by the accessory drive components and the crankshaft.

The drive belt system may have an idler pulley, which is used to add wrap to the adjacent pulleys. Some systems use an idler pulley in place of an accessory drive component when the vehicle is not equipped with the accessory.

Engine Component Description

Engine Construction

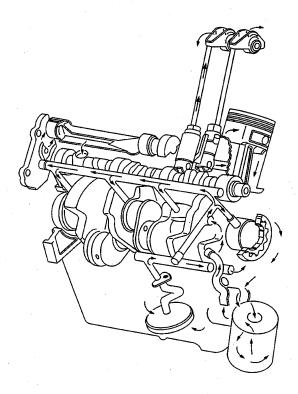

Starting at the front of the engine, the cylinders of the left bank are numbered 1-3-5 and the cylinders of the right bank are numbered 2-4-6. The crankshaft is supported in the engine block by four bearings. The crankshaft is counterbalanced by the flywheel, the crankshaft balancer, and the weights cast into the crankshaft. Additional counterbalancing is obtained from the balance shaft which rides in the engine block above the camshaft and is driven by the camshaft. All 3800 engines are even-firing, the cylinders fire at equal 120 degree intervals of crankshaft rotation. The location of the crankshaft journals has been offset by 30 degrees to fire the cylinders at 120 degree intervals of crankshaft rotation. The camshaft lobes and timing also reflect the 120 degree intervals. The even firing crankshaft provides an equal interval of 120 degrees between ignition of each of the cylinders throughout the firing order. The firing order is 1-6-5-4-3-2. The aluminum alloy pistons have slipper skirts and are cam turned. Four drilled holes or casted slots in the oil ring grooves permit drain back of the oil collected by the oil ring. The camshaft is supported by four bearings in the engine block and is driven by the crankshaft through sprockets and a timing chain. The cylinder heads are cast iron and incorporate integral valve stem guides. Right and left cylinder heads are identical and are interchangeable, but it is good practice to reinstall the cylinder heads on the side from which they are removed. The intake manifold is bolted to the inner faces of both cylinder heads so it connects with all inlet ports.

Each exhaust and intake valve has a valve spring to insure positive seating throughout the operating speed range. The valve rocker arms for each bank of the cylinders pivot on pedestals bolted to the cylinder head. Hydraulic roller valve lifters and tubular push rods are used to operate overhead rocker arms and valves of both banks of the cylinders from a single camshaft. This system requires no lash adjustment at the time of assembly or service.

In addition to its normal function of a cam follower, each valve lifter also serves as an automatic adjuster which maintains zero lash in the valve train under all operating conditions. By eliminating all lash in the valve train and also providing a cushion of oil to absorb operating shocks, the valve lifter promotes quiet valve operation. It also eliminates the need for periodic valve adjustment to compensate for wear of parts. Oil is supplied to the valve lifter through a hole in the side of the valve lifter body which indexes with a groove and a hole in the valve lifter plunger. Oil is then metered past the oil metering valve in the valve lifter, through the push rods to the valve rocker arms. When the valve lifter begins to move up the camshaft lobe, the check ball is held against its seat in the plunger by the check ball spring which traps the oil in the base of the valve lifter body below the plunger.

The plunger and the valve lifter body then raise as a unit, pushing up the push rod to open the valve. The force of the valve spring which is exerted on the plunger through the valve rocker arm and push rod, causes a slight amount of leakage between the plunger and the valve lifter body. This leakage allows a slow escape of trapped oil in the base of the valve lifter body. As the valve lifter rolls down the other side of the camshaft lobe and reaches the base circle or valve closed position, the plunger spring quickly moves the plunger back (up) to its original position. This movement causes the check ball to open against the ball spring, and any oil inside the plunger is drawn into the base of the valve lifter. This restores the valve lifter to the zero lash.

Lubrication Description

The engine lubrication system is of the force-feed type. The oil is supplied under full pressure to the crankshaft, connecting rods, valve lifters, camshaft, and rear balance shaft bearing. A controlled volume of oil is supplied to the valve rocker arms and push rods. All other moving parts are lubricated by gravity flow or splash. The engine oil is stored in the lower crankcase (oil pan) which is filled through a filler opening in the valve rocker arm cover. A removable oil level indicator, on the left side of the engine block, is provided to check the oil level. The oil pump is located in the engine front cover and is driven by the crankshaft. It is a gerotor-style pump which is a combination of a gear and a rotor pump. It is connected by a passage in the cylinder block to an oil screen and pipe assembly. The screen is submerged in the oil supply and has ample volume for all operating conditions. If the screen becomes clogged, oil may be drawn into the system through the oil pressure relief valve in the oil filter adapter. Oil is drawn into the

pump through the screen and pipe assembly, and a passage in the crankcase, connecting to the passages in the engine front cover. Oil is discharged from the oil pump to the oil filter adapter. The oil filter adapter consists of an oil filter bypass valve and a nipple for installation of an oil filter. The spring-loaded oil pressure relief valve, located in the engine front cover, limits the oil pressure. The oil filter bypass valve opens when the oil filter is restricted to approximately 68.95 kPa (10 psi) of pressure difference between the oil filter inlet and discharge. The oil will then bypass the oil filter and channel unfiltered oil directly to the main oil galleries of the engine. A full-flow oil filter is externally mounted to the oil filter adapter on the lower right front side of the engine. If the filter element becomes restricted, not allowing engine oil to pass through, a spring-loaded bypass valve opens. The main oil galleries run the full length of the engine block and cut into the valve lifter guide holes to supply oil at full pressure to the valve lifters. Holes, drilled from the crankshaft bearings to the main oil gallery, intersect the camshaft bearing bores to supply oil to the cam bearings.

Oil is transfered from the crankshaft bearings to the connecting rod bearings through holes drilled in the crankshaft. Pistons, piston pins, and cylinder walls are lubricated by oil splash from the crankshaft and connecting rods.

Each valve rocker arm and valve is supplied with oil through the tubular push rod. The oil comes from the inside of the valve lifter passing around the metering valve and through a hole in the push rod seat. Oil from the push rod passes through a hole in the push rod seat, and emerges on top of the push rod seat boss.

Cooling System Description and Operation

Coolant Heater

The optional engine coolant heater (RPO K05) operates using 110-volt AC external power and is designed to warm the coolant in the engine block area for improved starting in very cold weather -29°C (-20°F). The coolant heater helps reduce fuel consumption when a cold engine is warming up. The unit is equipped with a detachable AC power cord. A weather shield on the cord is provided to protect the plug when not in use.

Cooling System

The cooling system's function is to maintain an efficient engine operating temperature during all engine speeds and operating conditions. The cooling system is designed to remove approximately one-third of the heat produced by the burning of the air-fuel mixture. When the engine is cold, the coolant does not flow to the radiator until the thermostat opens. This allows the engine to warm quickly.

Cooling Cycle

Coolant flows from the radiator outlet and into the water pump inlet. Some coolant flows from the water pump, to the heater core, then back to the water pump. This provides the passenger compartment with heat and defrost capability as the coolant warms up.

Coolant also flows from the water pump outlet and into the engine block. In the engine block, the coolant circulates through the water jackets surrounding the cylinders where it absorbs heat.

The coolant then flows through the cylinder head gasket openings and into the cylinder heads. In the cylinder heads, the coolant flows through the water jackets surrounding the combustion chambers and valve seats, where it absorbs additional heat.

From the cylinder heads, the coolant flows to the thermostat. The flow of coolant will either be stopped at the thermostat until the engine reaches normal operating temperature, or it will flow through the thermostat and into the radiator where it is cooled. At this point, the coolant flow cycle is completed.

Efficient operation of the cooling system requires proper functioning of all cooling system components. The cooling system consists of the following components:

Coolant

The engine coolant is a solution made up of a 50-50 mixture of DEX-COOL and suitable drinking water. The coolant solution carries excess heat away from the engine to the radiator, where the heat is dissipated to the atmosphere.

Radiator

The radiator is a heat exchanger. It consists of a core and two tanks. The aluminum core is a tube and fin crossflow design that extends from the inlet tank to the outlet tank. Fins are placed around the outside of the tubes to improve heat transfer to the atmosphere.

The inlet and outlet tanks are a molded, high temperature, nylon reinforced plastic material. A high temperature rubber gasket seals the tank flange edge to the aluminum core. The tanks are clamped to the core with clinch tabs. The tabs are part of the aluminum header at each end of the core.

The radiator also has a drain cock located in the bottom of the left hand tank. The drain cock unit includes the drain cock and drain cock seal.

The radiator removes heat from the coolant passing through it. The fins on the core transfer heat from the coolant passing through the tubes. As air passes between the fins, it absorbs heat and cools the coolant.

Pressure Cap

The pressure cap seals the cooling system. It contains a blow off or pressure valve and a vacuum or atmospheric valve. The pressure valve is held against its seat by a spring, which protects the radiator from excessive cooling system pressure. The vacuum valve is held against its seat by a spring, which permits opening of the valve to relieve vacuum created in the cooling system as it cools off. The vacuum, if not relieved, might cause the radiator and/or coolant hoses to collapse.

The pressure cap allows cooling system pressure to build up as the temperature increases. As the pressure builds, the boiling point of the coolant increases. Engine coolant can be safely run at a temperature much higher than the boiling point of the coolant at atmospheric pressure. The hotter the coolant is, the faster the heat transfers from the radiator to the cooler, passing air.

The pressure in the cooling system can get too high. When the cooling system pressure exceeds the rating of the pressure cap, it raises the pressure valve, venting the excess pressure.

As the engine cools down, the temperature of the coolant drops and a vacuum is created in the cooling system. This vacuum causes the vacuum valve to open, allowing outside air into the surge tank. This equalizes the pressure in the cooling system with atmospheric pressure, preventing the radiator and coolant hoses from collapsing.

Coolant Recovery System

The coolant recovery system consists of a plastic coolant recovery reservoir and overflow tube. The recovery reservoir is also called a recovery tank or expansion tank. It is partially filled with coolant and is connected to the radiator fill neck with the overflow tube. Coolant can flow back and forth between the radiator and the reservoir.

In effect, a cooling system with a coolant recovery reservoir is a closed system. When the pressure in the cooling system gets too high, it will open the pressure valve in the pressure cap. This allows the coolant, which has expanded due to being heated, is allowed to flow through the overflow tube and into the recovery reservoir. As the engine cools down, the temperature of the coolant drops and a vacuum is created in the cooling system. This vacuum opens the vacuum valve in the pressure cap, allowing some of the coolant in the reservoir to be siphoned back into the radiator. Under normal operating conditions, no coolant is lost. Although the coolant level in the recovery reservoir goes up and down, the radiator and cooling system are kept full. An advantage to using a coolant recovery reservoir is that it eliminates almost all air bubbles from the cooling system. Coolant without bubbles absorbs heat much better than coolant with bubbles.

Air Baffles and Seals

The cooling system uses deflectors, air baffles and air seals to increase cooling system capability. Deflectors are installed under the vehicle to redirect airflow beneath the vehicle and through the radiator to increase engine cooling. Air baffles are also used to direct airflow through the radiator and increase cooling capability. Air seals prevent air from bypassing the radiator and A/C condenser, and prevent recirculation of hot air for better hot weather cooling and A/C condenser performance.

Water Pump

The water pump is a centrifugal vane impeller type pump. The pump consists of a housing with coolant inlet and outlet passages and an impeller. The impeller is mounted on the pump shaft and consists of a series of flat or curved blades or vanes on a flat plate. When the impeller rotates, the coolant between the vanes is thrown outward by centrifugal force.

The impeller shaft is supported by one or more sealed bearings. The sealed bearings never need to be lubricated. Grease cannot leak out, dirt and water cannot get in as long as the seal is not damaged or worn.

The purpose of the water pump is to circulate coolant throughout the cooling system. The water pump is driven by the crankshaft via the drive belt.

Thermostat

The thermostat is a coolant flow control component. It's purpose is to help regulate the operating temperature of the engine. It utilizes a temperature sensitive wax-pellet element. The element connects to a valve through a small piston. When the element is heated, it expands and exerts pressure against the small piston. This pressure forces the valve to open. As the element is cooled, it contracts. This contraction allows a spring to push the valve closed.

When the coolant temperature is below the rated thermostat opening temperature, the thermostat valve remains closed. This prevents circulation of the coolant to the radiator and allows the engine to warm up. After the coolant temperature reaches the rated thermostat opening temperature, the thermostat valve will open. The coolant is then allowed to circulate through the thermostat to the radiator where the engine heat is dissipated to the atmosphere. The thermostat also provides a restriction in the cooling system, after it has opened. This restriction creates a pressure difference which prevents cavitation at the water pump and forces coolant to circulate through the engine block.

Engine Oil Cooler

The engine oil cooler is a heat exchanger. It is located inside the left side end tank of the radiator. The engine oil temperature is controlled by the temperature of the engine coolant that surrounds the oil cooler in the radiator.

The engine oil pump, pumps the oil through the engine oil cooler line to the oil cooler. The oil then flows through the cooler where the engine coolant absorbs heat from the oil. The oil is then pumped through the oil cooler return line, to the oil filter, to the engine block oil system.

Transmission Oil Cooler

The transmission oil cooler is a heat exchanger. It is located inside the right side end tank of the radiator. The transmission fluid temperature is regulated by the temperature of the engine coolant in the radiator.

The transmission oil pump, pumps the fluid through the transmission oil cooler line to the transmission oil cooler. The fluid then flows through the cooler where the engine coolant absorbs heat from the fluid. The fluid is then pumped through the transmission oil cooler return line, to the transmission.

Battery Description and Operation

Caution

Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.
- Follow each step of the jump starting procedure in order.
- Treat both the booster and the discharged batteries carefully when using the jumper cables.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for two small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

The battery has three functions as a major source of energy:

- Engine cranking
- Voltage stabilizer
- Alternate source of energy with generator overload.

The battery specification label (example below) contains information about the following:

- The test ratings
- The original equipment catalog number
- The recommended replacement model number

CATALOG NO.

1819

CCA LOAD TEST
770 380

REPLACEMENT MODEL
100 – 6YR

A battery has 2 ratings:

- Reserve capacity
- Cold cranking amperage

When a battery is replaced use a battery with similar ratings. Refer to the battery specification label on the original battery or refer to Battery Usage .

Reserve Capacity

Reserve capacity is the amount of time in minutes it takes a fully charged battery, being discharged at a constant rate of 25 amperes and a constant temperature of 27°C (80°F) to reach a terminal voltage of 10.5 V. Refer to Battery Usage for the reserve capacity rating of the original equipment battery.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18°C (0°F) while maintaining at least 7.2 volts. Refer to Battery Usage for the cold cranking amperage rating for this vehicle.

Circuit Description

The battery positive terminal supplies Battery Positive voltage to the under hood fuse block and the rear fuse block. The under hood fuse block provides a cable connection for the generator and a cable connection for the starter.

The battery negative terminal is connected to chassis ground G305 and supplies ground for the AD converter in the DIM.

Starting System Description and Operation

This vehicle has two starter motor applications. The 3400 LA1 (VIN E) uses the PG260 F1 starter motor. The 3800 L36 (VIN K) uses the PG260 F2 starter motor.

These starter motors have pieces that are arranged around the armature. The solenoid windings are energized when the ignition switch is turned to START. The resulting plunger and shift lever movement

causes the pinion to engage the flywheel ring gear and the solenoid main contact switch to close. When the engine starts, the pinion overrun protects the armature from excessive speed until the switch is opened. Once the solenoid windings are de-energized, the return spring causes the pinion to disengage.

Charging System Description and Operation

A Delphi CS130D 105 ampere generator is standard equipment on this vehicle. A Bosch NCB1 125 ampere generator is used for the police (9C1) and the taxi (9C6) options. The components of these generators include the following:

The generator provides voltage to operate the vehicle's electrical system and to charge the battery. A magnetic field is created when current flows through the rotor. This field rotates as the rotor is driven by the engine, creating an AC voltage in the stator windings. The AC voltage is converted to DC by the rectifier bridge and is supplied to the electrical system at the battery terminal.

The generator's digital regulator uses digital techniques to supply the rotor current and thereby control the output voltage. The rotor current is proportional to the width of the electrical pulses supplied by the digital regulator. When the ignition switch is ON, voltage is supplied to terminal L from the Powertrain Control Module (PCM), turning on the digital regulator. Narrow width pulses are supplied to the digital rotor, creating a weak magnetic field. When the engine is started, the digital regulator senses generator rotation by detecting AC voltage at the stator through an internal wire. Once the engine is running, the digital regulator varies the field current by controlling the pulse width. This regulates the generator output voltage for proper battery charging and electrical system operation.

Fuel System Specifications

If you have the 3100 V6 engine (VIN Code M) or 3800 V6 engine (VIN Code K), use regular unleaded gasoline rated at 87 octane or higher. IF you are using fuel rated at the recommended octane or higher and you hear a little pinging noise when you are accelerating or driving up a hill that is normal. You do not need to buy a higher octane fuel to get rid of pinging. It is the heavy, constant knock that means there is a problem.

If you have the 3800 Supercharged V6 engine (VIN Code 1), use premium unleaded gasoline rated at 91 octane or higher. With the 3800 Supercharged engine, in an emergency, you may be able to use an octane as low as 87, if heavy knocking does not occur. If you are using 91 or higher octane unleaded gasoline and you hear heavy knocking, your engine needs service.

It is recommended that the gasoline meet specifications which have been developed by the American Automobile Manufactures Association (AAMA) and endorsed by the Canadian Motor Vehicle Manufacturers Association for better vehicle performance and engine protection. Gasolines meeting the AAMA specification could provide improved driveability and emission control system performance compared to other gasolines. For more information, write to: American Automobile Manufacturer's Association, 7430 Second Ave, Suite 300, Detroit MI 48202.

Be sure the posted octane is at least 91 for premium, at least 90 for middle grade, and at least 87 for regular grade. If the octane is less than 87, you may get a heavy knocking noise when you drive. If it is bad enough, it can damage your engine.

Notice

Your vehicle was not designed for fuel that contains methanol. Do not use methanol fuel which can corrode metal parts in your fuel system and also damage plastic and rubber parts. This kind of damage would not be covered under your warranty.

If your vehicle is certified to meet California Emission Standards, as indicated on the under hood emission control label, it is designed to operate on fuels that meet California specifications. If such fuels are not available in states adopting California emissions standards, your vehicle will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be affected. The malfunction indicator lamp on your instrument panel may turn on and/or your vehicle may fail a smogcheck test. If this occurs, return to your authorized dealer for diagnosis to determine the cause of failure. In the event it is determined that the cause of the condition is the type of fuels used, repairs may not be covered by your warranty.

Some gasolines that are not reformulated for low emissions may contain an octane-enhancing additive called methylcyclopentadienyl manganese tricarbonyl (MMT). Ask your service station operator whether or not the fuel contains MMT.

Exhaust System Description

Important

Use of non-OEM parts may cause driveability concerns.

The exhaust system design varies according to the model designation and the intended use of the vehicle.

In order to secure the exhaust pipe to the exhaust manifold, the exhaust system utilizes a flange and seal joint coupling. A flange and gasket coupling secures the catalytic converter assembly to the muffler assembly.

Hangers suspend the exhaust system from the underbody, allowing some movement of the exhaust system and disallowing the transfer of noise and vibration into the vehicle.

Heat shields protect the vehicle from the high temperatures generated by the exhaust system.

Resonator

Some exhaust systems are equipped with a resonator. The resonator, located either before or after the muffler, allows the use of mufflers with less back pressure. Resonators are used when vehicle characteristics require specific exhaust tuning.

Catalytic Converter

The catalytic converter is an emission control device added to the engine exhaust system in order to reduce hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) pollutants from the exhaust gas.

The catalytic converter is comprised of a ceramic monolith substrate, supported in insulation and housed within a sheet metal shell. The substrate may be washcoated with 3 noble metals:

- Platium (Pt)
- Palladium (Pd)
- Rhodium (Rh)

The catalyst in the converter is not serviceable.

Muffler

The exhaust muffler reduces the noise levels of the engine exhaust by the use of tuning tubes. The tuning tubes create channels inside the exhaust muffler that lower the sound levels created by the combustion of the engine.

Transmission Component and System Description

Transmission General Description

The 4T65-E is a fully automatic front wheel drive electronically controlled transmission. The 4T65-E provides four forward ranges including overdrive. The PCM controls shift points by means of two shift solenoids. A vane-type oil pump supplies the oil pressure. The PCM regulates oil pressure by means of a pressure control solenoid valve.

All vehicles equipped with a 4T65-E transmission have an electronically controlled capacity clutch (ECCC) system. In the ECCC system, the pressure plate does not fully lock to the torque converter cover. It is instead, precisely controlled to maintain a small amount of slippage between the engine and the turbine, reducing driveline torsional disturbances.

You can operate the transmission in any one of the following seven modes:

- P -- Park position prevents the vehicle from rolling either forward or backward. For safety reasons, use the parking brake in addition to the park position.
- R -- Reverse allows the vehicle to be operated in a rearward direction.
- N -- Neutral allows the engine to be started and operated while driving the vehicle. If necessary, you may select this position in order to restart the engine with the vehicle moving.
- D -- Overdrive is used for all normal driving conditions. Overdrive provides four gear ratios plus a converter clutch operation. Depress the accelerator in order to downshift for safe passing.
- 3 -- Drive position is used for city traffic and hilly terrain. Drive provides three gear ranges and
 drive range prevents the transmission from operating in fourth gear. Depress the accelerator in
 order to downshift.
- 2 Manual Second provides two gear ratios under most operating conditions. Manual Second provides acceleration and engine braking. Select this range at any vehicle speed, but the transmission will not downshift into Second gear until the vehicle speed drops below approximately 100 km/h (62 mph)
- 1 -- Manual Lo provides maximum engine braking. You may also select this range at any vehicle speed, but the transmission will not downshift into First gear until the vehicle speed drops below approximately 60 km/h (37 mph).

Mechanical Componants

The mechanical components of this unit are as follows:

- A torque converter with an Electronically Controlled Capacity Clutch (ECCC)
- A drive link assembly
- 4 multiple disk clutch assemblies: Input, Second, Third and Fourth
- 3 friction bands: Forward band, 2/1 band and Reverse band
- 2 planetary gear sets: Input and Reaction
- 3 one-way clutches: a roller clutch (1-2 support) and 2 sprag clutches (Third and Input)
- A final drive and differential assembly
- A control valve assembly
- A vane type oil pump

The electrical components of this unit are as follows:

- 2 shift solenoid valves
- A torque converter clutch pulse width modulation (TCC PWM) solenoid valve
- A pressure control (PC) solenoid valve
- An automatic transmission fluid temperature (TFT) sensor
- 2 speed sensors: input shaft and vehicle speed sensors
- An automatic transmission fluid pressure (TFP) manual valve position switch
- Either an Internal Mode Switch or an exterior-mounted Transmission Range Switch.

An automatic transmission (A/T) wiring harness assembly

Adapt Function

The 4T65-E transmission uses a line pressure control system, that has the ability to adapt line pressure to compensate for normal wear of the following parts:

- The clutch fiber plates
- The springs and seals
- The apply bands

The PCM maintains information for the following transmission adaptive systems:

Upshift Adapts (1-2, 2-3 and 3-4)

The PCM monitors the automatic transmission input shaft speed (AT ISS) sensor and the vehicle speed sensor (VSS) in order to determine when an upshift has started and completed. The PCM measures the time for the upshift. If the upshift time is longer than a calibrated value, then the PCM will adjust the current to the pressure control (PC) solenoid valve to increase the line pressure for the next shift in the same torque range. If the upshift time is shorter than the calibrated value, then the PCM will decrease the line pressure for the next shift in the same torque range.

Steady State Adapts

The PCM monitors the AT ISS sensor and the VSS after an upshift in order to determine the amount of clutch slippage. If excessive slippage is detected, then the PCM will adjust the current to the PC solenoid valve in order to increase the line pressure to maintain the proper gear ratio for the commanded gear.

The TAP information is divided into 13 units, called cells. The cells are numbered 4 through 16. Each cell represents a given torque range. TAP cell 4 is the lowest adaptable torque range and TAP cell 16 is the highest adaptable torque range. It is normal for TAP cell values to display zero or negative numbers. This indicates that the PCM has adjusted line pressure at or below the calibrated base pressure.

Automatic Transmission Shift Lock Control Description

The automatic transmission shift lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the shift lever out of the PARK position. The system consist of the following components:

- The automatic transmission shift lock control solenoid.
- The automatic transmission shift lock control switch.
- The body control module (BCM).
- The powertrain control module (PCM).

With the ignition in the ON position, battery positive voltage is supplied to the automatic transmission shift lock control switch. The circuit continues through the normally-closed switch to the automatic transmission shift lock control solenoid. The body control module (BCM) provides a ground for the automatic transmission shift lock control solenoid when the transmission is in the PARK position. The body control module (BCM) receives the transmission gear position information via class2 serial data from the powertrain control module (PCM). This causes the automatic transmission shift lock control solenoid to energize and lock the shift lever in the PARK position. When the driver presses the brake pedal, the contacts in the automatic transmission shift lock control solenoid to release. This allows the shift lever to move from the PARK position. The body control module (BCM) turns off the automatic transmission shift lock control solenoid ground circuit when the transmission is out of the PARK position.

Fasteners

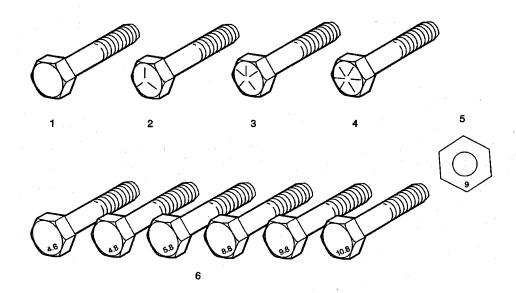

Metric Fasteners

This vehicle provides fastener dimensions using the metric system. Most metric fasteners are approximate in diameter to equivalent English fasteners. Make replacements using fasteners of the same nominal diameter, thread pitch, and strength.

A number marking identifies the OE metric fasteners except cross-recess head screws. The number also indicates the strength of the fastener material. A Posidrive® or Type 1A cross-recess identifies a metric cross-recess screw. For best results, use a Type 1A cross-recess screwdriver, or equivalent, in Posidrive® recess head screws.

GM Engineering Standards and North American Industries have adopted a portion of the ISO-defined standard metric fastener sizes. The purpose was to reduce the number of fastener sizes used while retaining the best thread qualities in each thread size. For example, the metric M6.0 X 1 screw, with nearly the same diameter and 25.4 threads per inch replaced the English 1/4-20 and 1/4-28 screws. The thread pitch is midway between the English coarse and fine thread pitches.

Fastener Strength Identification

- 1. English Bolt, Grade 2 (Strength Class)
- 2. English Bolt, Grade 5 (Strength Class)
- 3. English Bolt, Grade 7 (Strength Class)
- English Bolt, Grade 8 (Strength Class)
- 5. Metric Nut, Strength Class 9
- Metric Bolts, Strength Class Increases as Numbers Increase

The most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt. The English, inch strength classes range from grade 2 to grade 8. Radial lines are embossed on the head of each bolt in order to identify the strength class. The number of lines on the head of the bolt is 2 lines less than the actual grade. For example, a grade 8 bolt will have 6 radial lines on the bolt head. Some metric nuts are marked with a single digit strength identification number on the nut face.

The correct fasteners are available through GM SPO. Many metric fasteners available in the aftermarket parts channels are designed to metric standards of countries other than the United States, and may exhibit the following:

- Lower strength
- No numbered head marking system
- Wrong thread pitch

The metric fasteners on GM products are designed to new, international standards. The following are the common sizes and pitches, except for special applications:

- M6.0 X 1
- M8 X 1.25
- M10 X 1.5
- M12 X 1.75
- M14 X 2.00
- M16 X 2.00

Prevailing Torque Fasteners

Prevailing torque fasteners create a thread interface between the fastener and the fastener counterpart in order to prevent the fastener from loosening.

All Metal Prevailing Torque Fasteners

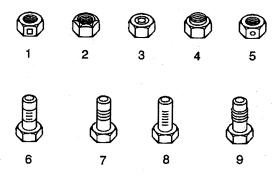

These fasteners accomplish the thread interface by a designed distortion or deformation in the fastener.

Nylon Interface Prevailing Torque Fasteners

These fasteners accomplish the thread interface by the presence of a nylon material on the fastener threads.

Adhesive Coated Fasteners

These fasteners accomplish the thread interface by the presence of a thread-locking compound on the fastener threads. Refer to the appropriate repair procedure in order to determine if the fastener may be reused and the applicable thread-locking compound to apply to the fastener.

1. Prevailing Torque Nut, Center Lock Type

- 2. Prevailing Torque Nut, Top Lock Type
- 3. Prevailing Torque Nut, Nylon Patch Type
- 4. Prevailing Torque Nut, Nylon Washer Insert Type
- 5. Prevailing Torque Nut, Nylon Insert Type
- 6. Prevailing Torque Bolt, Dry Adhesive Coating Type
- 7. Prevailing Torque Bolt, Thread Profile Deformed Type
- 8. Prevailing Torque Bolt, Nylon Strip Type
- 9. Prevailing Torque Bolt, Out-of-Round Thread Area Type

A prevailing torque fastener may be reused ONLY if:

- The fastener and the fastener counterpart are clean and not damaged
- There is no rust on the fastener
- The fastener develops the specified minimum torque against its counterpart prior to the fastener seating

Metric Prevailing Torque Fastener Minimum Torque Development

14 mm	2.3 N·m	20 lb in
16 mm	3.4 N·m	30 lb in
20 mm	5.5 N·m	49 lb in
24 mm	8.5 N·m	75 lb in

English Prevailing Torque Fastener Minimum Torque Development

Application	Specification	
	Metric	English
All Metal Prevailing Torque Fasten	ers	
1/4 in	0.5 N ⋅m	4.5 lb in
5/16 in	0.8 N·m	7.5 lb in
3/8 in	1.3 N·m	11.5 lb in
7/16 in	1.8 N ⋅m	16 lb in
1/2 in	2.3 N·m	20 lb in
9/16 in	3.2 N·m	28 lb in
5/8 in	4 N·m	36 lb in
3/4 in	7 N·m	54 lb in
Nylon Interface Prevailing Torque	Fasteners	
1/4 in	0.3 N·m	3 lb in
5/16 in	0.6 N·m	5 lb in
3/8 in	1 N·m	9 lb in
7/16 in	1.3 N·m	12 lb in
1/2 in	1.8 N·m	16 lb in
9/16 in	2.5 N·m	22 lb in
5/8 in	3.4 N·m	30 lb in
3/4 in	5 N·m	45 lb in
