### **Product Information**

### 2001 Malibu Carries Chevrolet Banner In The Midsize Market

**DETROIT** — For 2001 the popular Chevrolet Malibu adds functional and equipment improvements that enhance its overall stance as a value leader in the midsize car segment. Malibu brand manager,

Lew Elbert, says: "Since the new Malibu's introduction in 1997 we've been absolutely committed to providing the best quality, the best package of standard features and the best performance in a midsize sedan — and doing all that with affordability in mind."

### New For 2001

For 2001, Malibu benefits from dozens of enhancements to improve the ownership experience. Some of these details include: new exterior features for the Malibu Sedan like black molded-in-color outside rear view mirrors, black rocker moldings and optional black mudguards — all of which give the car a fresh new look.

Inside, the Malibu Sedan gets stylish new cloth on seats and door panels, a new ebony shift handle and the addition of retained accessory power that allows customers to listen to the radio for as long as ten minutes after the key has been switched off, or until a door is opened. LS models get this retained power feature as standard equipment, along with new cloth treatment and new front seatback map pockets.

Additional "smart" car features include a delayed headlamp off feature to give customers time to get from their car to their house. Also, the customer can now program the key fob for the available remote keyless entry system to flash the lights or honk the horn to confirm the Malibu is locked or unlocked.

Three new colors freshen Malibu's appearance for 2001: Monterrey Maroon Metallic, Galaxy Silver Metallic and Light Driftwood Metallic.

### **Malibu Models And Powertrain**

Two sedan models are offered — the Malibu and Malibu LS. Both feature a proven 3.1L V6 engine with sequential fuel injection, aluminum cylinder heads and as much as 170 horsepower and 190 lb-ft of torque. While an electronically controlled 4-speed automatic transmission handles shifting chores, a 4-wheel independent suspension along with big standard 15-inch all-season radial tires and rack-and-pinion power steering give the Malibu great ride and handling capability. Last but not least, standard 4-wheel antilock brakes provide excellent stopping response.

### **Malibu Standard Features**

Beyond all of the powertrain and suspension advantages Malibu offers there is a long list of other standard features, such as air conditioning, child security and lock-out protection features, a full gauge package with tachometer, rear seat heating ducts, theatre lighting, tinted glass, tilt steering column, AM/FM stereo radio, battery rundown protection, along with, for 2001, the addition of power door locks and an electric rear window defogger.

Customers who opt for the Malibu LS get all of the above plus additional features such as cruise control, power windows with driver's-side Express-Down feature, custom cloth bucket seats with 6-way power on the driver's side, front and rear body-color mudguards, dual remote electric outside rear view mirrors and 15-inch cast aluminum wheels. The standard LS radio is an AM/FM stereo with compact disc and cassette players, TheftLock™, speed-compensated volume control, auto tone control and Radio Data Systems (RDS) technology.

# **Malibu History**

The first Malibu was a version of the popular midsize Chevelle.

- 1964 The Malibu name debuts as the designation for top series models in the new Chevelle line
- 1968 First all-new body and interior since '64 introduction; 2-Door and 4-Door models now have different wheelbase lengths
- 1973 Longer, wider Chevelle Malibu models are introduced, including new 2-Door Coupe models with "Colonnade" pillared roof design
- 1975 Improved 250 cid 6-cylinder engine is featured in Chevelle Malibu; catalytic converter added to all models
- 1978 New Malibu line debuts as Chevelle nameplate is dropped
- 1982 As Chevrolet prepares to introduce a new front-wheel-drive midsize Celebrity model line midyear, only two Malibu Classic model free effered a 4-Door Sedan and a wagon
- 1983 Final year for a rear-wheel-drive Malibu (although El Camino, a Malibu variant, continues to 1987)
- 1997 All-new, contemporary, midsize, front-wheel-drive Malibu debuts in Malibu Sedan and Malibu LS trim levels
- 2000 The 3100 V6 becomes standard in both the Malibu Sedan and Malibu LS

### What's New

# **Brand Identity**

The Chevrolet Malibu features a 3100 V6 and a standard 4-speed electronic transmission. Other highlights include a tri-link suspension and standard 4-wheel antilock brakes. In addition, Malibu is designed to make the driver's ride more enjoyable, with features such as automatic door locks with lockout protection and Remote Keyless Entry personalization (standard on LS, optional on Sedan).

### Interior

- Rear-window defogger standard on all models
- Malibu Sedan features new cloth on seats
- LS models feature new cloth on seats with new front seatback map pockets (driver and front passenger)
- Radio Data System (RDS) feature is added to cassette, CD and dual playback units
- Power door locks standard on all models
- Dual playback integrated into one unit
- Retained Accessory Power allows radio operation when the key is off for 10 minutes or until the driver door is opened
- "Personalization" feature when the car is equipped with RKE (Remote Keyless Entry) allows the radio to remember uniquely for each key fob: AM/FM1/FM2 station presets (EQ and tone control for each), last loudness level and last audio source on (tuner/cassette/CD)

### Exterior

- New colors include Monterey Maroon Metallic, Galaxy Silver Metallic, Light Driftwood Metallic
- Enhanced Gold Package (Malibu LS). Includes gold center grille bar, wheel center cap emblems, and interior and exterior gold badging.
- Center cap for aluminum wheel in chrome and gold versions.
- Rear, driver-side "V6" badge
- Black rocker moldings, standard on Malibu Sedan
- Black mud guards, optional on Malibu Sedan

### **Functional**

- Delayed locking feature with door switch for customer convenience
- Programmable automatic door locking/unlocking for customer preference
- Automatic Light Control Dim-to-Park feature allows customer to turn off headlamps at night when automatic lighting control mode is in effect; park lamps are on
- Automatic Delayed Headlamp Off feature provides 20 seconds of headlamp-on operation after key off at night to provide illuminated exit convenience; customer can override with headlamp switch
- Door Locking/Unlocking Confirmation feature allows programming on or off horn chirp confirmation of door locking via door switch or key FOB, also provides park lamp flash (twice) when locking or unlocking the doors
- New tires and retuned suspension
- Dual internal fan generator

# **Vehicle Overview**

### Models

- Malibu Sedan
- Malibu LS Sedan

# **Special Packages**

Enhanced Gold Package (Malibu LS). Includes gold center grille bar, wheel center cap emblems, and interior and exterior gold badging.

### **Customer Profile**

The Chevrolet Malibu is targeted at a very diverse group of people (demographically), who are also very focused on finding the best overall value with the best overall package of features to meet the "midsize" needs of their everyday life.

# Buyer Demographics

Median age:	47 Years
Median household income:	\$50,000
Purchaser (male/female):	45%/55%
Married:	60%
Children in household:	42.5%
College graduates:	41%

### Competition

- Toyota Camry
- Honda Accord
- Nissan Altima
- Dodge Stratus

### **Color and Trim**

### **Exterior Colors**

- Black
- Dark Jade Green Metallic (until Spring 2001)
- Monterey Maroon Metallic
- Galaxy Silver Metallic
- Light Driftwood Metallic
- Bright White
- Navy Blue Metallic
- Medium Bronzemist Metallic

### **Interior Fabric and Colors**

- Neutral Cloth
- Gray Cloth
- Neutral Custom Cloth
- Gray Custom Cloth
- Neutral Leather (LS Model only)
- Gray Leather (LS Model only)

# **Engine**

# 3100 V6 SFI Engine

# Technical Features of the 3100 V6 Engine:

- Cast-iron block
- Assembled camshaft design
- Sequential Fuel Injection (SFI)
- Single coolant temperature sensor
- 24x ignition
- Platinum-tip spark plugs
- Single serpentine accessory drive belt
- Extended-life engine coolant\*

### **Transmission**

# 4T40-E 4-Speed Electronic Automatic Transmission

# **Technical Features of the 4T40-E Transmission:**

- Lightweight design
- Electronically controlled converter clutch
- Long-life automatic transmission fluid\*
- Electronic controls for seamless shifts
- Second-gear start capability
- Brake/transmission shift interlock

### Suspension

### **Front Suspension**

- Independent MacPherson coil-over-strut suspension
- 24mm front stabilizer bar

Maintenance needs vary with different uses and driving conditions. See the Owner's Manual for more information.

Maintenance needs vary with different uses and driving conditions. See the Owner's Manual for more information.

### **Rear Suspension**

- Independent tri-link with coil-over-strut
- 15mm stabilizer bar

# Steering

Power rack-and-pinion for both models

### Brakes

- Front disc/rear drum
- 4-wheel ABS standard

# Wheels and Tires.

### Wheels

15-inch x 6-inch bolt-on full wheel covers - standard on Malibu Sedan

15-inch x 6-inch aluminum wheel – standard on Malibu LS Sedan, optional on Malibu Sedan

### **Tires**

- P215/60R-15 blackwall touring tires
- Compact spare tire

Max. tongue load (lbs./kg)	100/45	

<sup>(1)</sup> Properly equipped. Maximum trailer weight is calculated by assuming only the driver is in the tow vehicle. Optional equipment, passengers or cargo will reduce the trailer weight rating.

# **Vehicle Identification**

# **Vehicle Identification Number (VIN)**

The vehicle identification number (VIN) plate is the legal identifier of the vehicle. The VIN plate is located on the upper LH corner of the Instrument Panel and can be seen through the windshield from the outside of the vehicle:

Position	Definition	Character	Description
1	Country of Origin	1	U.S.A.
2	Manufacturer	G	General Motors
3	Make	1	Chevrolet
4-5	Carline/Series	N/D N/E	Malibu LX Malibu LS
6	Body Style	5	Four Door Sedan (69)
7	Restraint System	2	Active (Manual) Belts w/Driver and Passenger Inflatable Restraint System
8	Engine Type	J	LG8 (3.1L)
9	Check Digit		Check Digit
10	Model Year	1	2001
11	Plant Location	Y 6	Wilmington, DE Oklahoma City, OK
12-17	Plant Sequence Number		Plant Sequence Number

# **VIN Derivative**

All engines and transmissions are stamped or laser etched with a partial vehicle identification number (VIN), which was derived from the complete VIN. A VIN derivative contains the following nine positions:

Position	Definition	Character	Description
1	GM Division Identifier	1	Chevrolet
2	Model Year	1	2001
3	Assembly Plant	Y	Wilmington, DE
4-9	Plant Sequence Number		Oklahoma City, OK 

A VIN derivative can be used to determine if a vehicle contains the original engine or transmission, by matching the VIN derivative positions to their accompanying positions in the complete VIN:

VIN Derivative Position	Equivalent VIN Position
1	3
2	10
3	11
4-9	12-17

### **Vehicle Certification Label**

- (1) Name of Manufacturer
- (2) Gross Vehicle Weight-Rating
- (3) Gross Axle Weight-Rating, Front, Rear
- (4) Canadian Safety Mark (w/RPO Z49)
- (5) Certification Statement
- (6) Vehicle Class Type (Pass Car, etc.)
- (7) Vehicle Identification Number
- (8) Date of Manufacture (Mo/Yr)

The vehicle certification label is permanently located on the edge of the driver's door. Refer to this label in order to obtain the following information:

- The Gross Vehicle Weight Rating (GVWR)
- The Gross Axle Weight Rating (GAWR), front and rear

The Gross Vehicle Weight (GVW) must not exceed the Gross Vehicle Weight Rating (GVWR).

The GVW is the weight of the vehicle and everything the vehicle carries. Include the following items when figuring the GVW:

- The base vehicle weight (factory weight)
- The weight of any added vehicle accessories
- The weight of the driver and the passenger
- The weight of any cargo being carried

The front and rear Gross Axle Weights (GAW) must not exceed the Gross Axle Weight Ratings (GAWR), front and rear .

The GAW is the weight exerted on one of the axles (front or rear).

# Service Parts Identification Label (SPID)

- (1) Vehicle Identification Number
- (2) Engineering Model Number (Vehicle Division, Vehicle Line and Body Style)
- (3) Interior Trim and Decor Level
- (4) Exterior (Paint Color) WA Number
- (5) Paint Technology
- (6) Special Order Paint Colors and Numbers
- (7) Vehicle Option Content

The service parts identification label is used to identify the original equipment options built into the specific vehicle being serviced. The option content of a vehicle is very important information to properly service the vehicle.

The service parts identification label is located on the inside of the rear compartment lid (1). Refer to RPO Code List below for a definition of the codes that are printed on the service parts identification label or referred to in this service information.

# Tire Placard

- (1) Specified Occupant Seating Positions
- (2) Total Occupant Seating
- (3) Maximum Vehicle Capacity Weight
- (4) Tire Pressures, Front, Rear, and Spare
- (5) Tire Speed Rating, Front, Rear, and Spare
- (6) Tire Label Code
- (7) Engineering Model Minus First Character
- (8) Tire Sizes, Front, Rear, and Spare
- (9) Vehicle Identification Number

The Tire Placard is permanently located on the edge of the driver's door. Refer to the placard to obtain:

- The maximum vehicle capacity weight
- The cold tire inflation pressures
- The tire sizes (original equipment tires)
- The tire speed ratings (original equipment tires)

# **Engine ID and VIN Derivative Location**

The eighth character in the Vehicle Identification Number (VIN) identifies the engine. Adhesive-backed labels attached to the engine, laser etching or stampings on the engine block indicate the engine unit number/date code. All engines are stamped with a VIN derivative. For more information on the VIN derivative, refer to VIN Derivative above.

# 3.1L Engine VIN Derivative Location(c)

The primary location (1) of the VIN derivative for the 3100 LG8 engine is shown.

The primary location (1) and the secondary location (2) for the Engine ID for the 3100 LG8 engine is on top of the RH rocker arm cover or front of RH oil pan rail.

# **Engine and Transmission Usage**

# Transmission ID and VIN Derivative Location 4T40-E (c)

All automatic transmissions have a metal identification (ID) nameplate (1) attached to the case exterior.

- (1) Transaxle
- (1) Transaxle
- (2) Calendar Year
- (2) Calendar Year
- (3) Julian Date or Day of the Year
- (3) Julian Date or Day of the Year
- (4) Shift (A=First Shift, B=Second Shift, C=Third Shift)
- (5) Model
- (6) Serial Number in Base Code 31
- (7) Plant
- (8) Hydramatic 4T40 E
- (9) Serial Number
- (10) Model
- (10) Model
- (11) Model Year
- (11) Model Year
- (12) Control Number
- (13) Line Built (1=Line 1, 2=Line 2, 3=Line 3, 4=Line 4)

# **Derivative Location 4T40-E/4T45-E(c)**

The Vehicle Identification Number (VIN) Derivative location for the 4T40E Transmission.

# Labeling - Anti-Theft

### **Notice**

The anti-theft label found on some major body panels MUST be covered before performing any painting, rustproofing or undercoating procedures. The mask must also be removed following those procedures. Failure to follow these precautionary steps may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

Federal law requires General Motors (GM) to affix a label to certain parts on selected vehicles with the Vehicle Identification Number (VIN). The purpose of this law is to reduce the number of motor vehicle thefts by helping in the tracing and recovery of parts from stolen vehicles. The certification label on the driver's door qualifies as a theft deterrent label.

The theft deterrent label will be permanently affixed to an interior surface of the part and will contain the complete VIN. The label on replacement parts will contain the letter R, the manufacturer's logo, and the acronym for the Department of Transportation (DOT). DO NOT deface, or remove these labels.

# **RPO Code List**

The production/process codes provide the description of the Regular Production Options (RPOs) used on the vehicle. The RPO list is printed on the Service Parts Identification Label. The following is a list of the RPO abbreviations and the description of each:

RPO	Description	
AG1	Seat, Power 6-Way adj.	
AK5	Restraint System Front Seat, Inflatable, Driver and Passenger	
AM9	Seat, Rear, Split Fold Down	
AP9	Restraint, Cargo Net	
AR9	Seats; Bucket, Reclining	
AU0	Remote Keyless Entry	
AU3	Power Door Locks	
A31	Window Power Operated, Side	
B37	Covering Floor Mats, Front and Rear Auxiliary	
CF5	Sun Roof, Glass, Sliding, Electric	
C60	HVAC System Air Conditioner, Front Manual Controls	
DC4	Mirror, Inside Rearview Tilt, Dual Reading Lamps	
DD9	Mirrors, Power - OSRV Breakaway, Painted	
DHB	Mirrors, Power - OSRV Breakaway	
DT3	Box Rear Stowage Compartment	
D37	OSRV Mirrors - Break - Away (Driver Side Remote/Pass Side Manual, Painted)	
E2F	Rapid Delivery System Forecast Holes	
E2P	Rapid Delivery System Popular Configuration	
FE1	Suspension System, Soft Ride	
F83	Transaxle Ratio, Final Drive 3.05	
JM4	Brakes System Power, Front Disc, Rear Drum, Cast iron, Antilock, Front and Rear Wheel	
KC4	Engine Oil Cooling System	
K05	Engine Block Heater	
K29	Module Powertrain Control	
K34	Cruise Control Automatic, Electronic	
K61	Generator, Enhanced Idle	
LG8	Engine, 3.1L, V6	
MN4	Transmission, Automatic 4 Speed, 4T40E	
MX0	Merchandised Transmission Automatic Provisions, Overdrive	
NB8	Emission Override California System	
NC1	Emission System California LEV	
NC7	Emission Override Federal System	
NF7	Emission System Federal NLEV	
NG1	Certification Emission, Geographically Restricted Registration	
NK5	Steering Wheel Standard	
NM2	Emission System Export, Leaded Fuel	
NP5	Steering Wheel Leather Wrapped	
N05	Lock Control Fuel Filler Cap	
N81	Fullsize Spare Tire	
PB4	Lock Control Wheel	
PF7	Wheel 15 x 6, Aluminum Cast, Styled	
PG1	Wheel 15 x 6, Steel	
QCD	Tire, P215/60R15 Touring Tire	
QLM	Tire, P215/60R15 All Season, Black Wall Tires	
T43	Rear Spoiler	
T61	Lighting, Daytime Running	

# 2001 Chevrolet Malibu Restoration Kit

T96	Front Fog Lamp	
UD4	Alarm Vehicle Speed, 120 K/H	
UH8	Cluster Instrument, Cool Temp, Trip Odom, Tach	
UL0	Radio, AM/FM Stereo, Seek/Scan, Auto Reverse Music Search Cassette, Auto Tone, Clock	
UL2	European Frequencies	
UM7	Radio, AM/FM Stereo, Seek/Scan, Clock	
UN0	Radio, AM/FM, Stereo, Seek/Scan, Compact Disc, Auto Tone, Clock	
UP0	Radio, AM/FM, Stereo, Seek/Scan, Auto Reverse Music Search Cassette, CD, Auto Tone, Clock	
US6	Antenna Fixed, Painted, Radio	
U19	Metric Scale Instrument Cluster	
U79	Speakers (4), 2 rear shelf, 1 coaxial per door	
VG9	Protector Wax, Exterior Body	
VH4	Front Mud Guards	
VR6	Hook Tie Down	
VY7	Leather Shift Knob	
V3I	Fuel Fill Charge Back	
WT9	Order Modification IES for Domestic Delivery	
W42	Performance Package, High Speed-Export Vehicle	
YF5	Certification Emission, California	
Y11	Sales Special Ornamentation (Gold)	
Y70	Headliner; Inc: Vanity Mirrors Covered No Light, Dome lamp w/3 Pos. Switch, Coat Hook-Rear Headliner. Mount, Visors w/Anchors	
Y71	Sunroof Headliner - Vanity Mirrors Covered - Pass Lighted, Power Switch and Bezel, Inside Rear View Mirror w/Dual Reading Lamps, Coat Hooks - Rear Headliner. Mount, Assist Handles (3), Visors w/Anchors, Dome Lamp w/3 Position Switch	
Y73	Uplevel Headliner; Inc: C95 - Dual Reading Lamp, Assist Handles, Overhead Storage Bin Between Visors	
Z49	Export Canadian Modification, Mandatory Base Equipment	
Z5X	Mirror Provisions, Arabic Language	

# **Technical Information**

# **Maintenance and Lubrication**

# **Capacities - Approximate Fluid**

Application	Specification	
Application	Metric	English
Automatic Transmission		
Pan Removal	6.5 liters	6.9 quarts
<ul> <li>Complete Overhaul</li> </ul>	9.0 liters	9.5 quarts
Complete Dry	12.2 liters	12.9 quarts
Engine Cooling System		
• 3.1L	12.9 liters	13.6 quarts
Engine Oil		
• 3.1L		
<ul> <li>with filter change</li> </ul>	4.25 liters	4.5 quarts
<ul> <li>without filter change</li> </ul>	3.75 liters	4.0 quarts
Fuel Tank	56.8 liters	14.3 gallons
Power Steering System	0.70 liters	1.5 pints

# **Maintenance Items**

Item	Type/Part Number	
Air Cleaner Filter, 3.1L	AC Type A-1279C	
Engine Oil Filter, 3.1L	AC Type PF47	
Spark Plug and Gap, 3.1L AC Type 41-940, 1.52 mm (0.060 in) G		
PCV Valve	AC Type CV892C	
Windshield Wiper Blades (Passenger Side) 48.0 cm (19.0 in)		
Windshield Wiper Blades (Driver Side)	56.0 cm (22.0 in)	

# **Tire Inflation Pressure Specifications**

Application	Specification	
••	Metric	English
Tire Inflation; Front Tires	200 kPa	29 psi
Tire Inflation; Rear Tires	180 kPa	26 psi
Tire Inflation; Compact Spare	420 kPa	60 psi

# **Fluid and Lubricant Recommendations**

Usage	Fluid/Lubricant
Automatic Transaxle	DEXRON®-III Automatic Transaxle Fluid
Engine Oil	Engine oil with the American Petroleum Institute Certified For Gasoline Engines Starburst symbol of the proper viscosity.
Engine Oil (Export)	In areas of the world other than North America, it may be difficult to find oils that display the API STARBURST, look for oils that meet the API Service SJ and ACEA requirements.
Engine Coolant	50/50 mixture of clean, drinkable water and GM Goodwrench® DEX-COOL® or Havoline® DEX-COOL® (silicate-free) coolant
Hood and Door Hinges	Multi-Purpose Lubricant, Superlube® (GM P/N 12346241 or equivalent)
Hood Latch Assembly,	Lubriplate® Lubricant Aerosol (GM P/N 12346293 or equivalent) or
Secondary Latch, Pivots, Spring Anchor and Release Pawl	lubricant meeting requirements of NLGI #2 Cataegory LB or GC-LB
Hydraulic Brake System	Delco Supreme 11® Brake Fluid (GM P/N 12377967 or equivalent DOT-3 brake fluid)
Key Lock Cylinders	Multi-Purpose Lubricant, Superlube® (GM P/N 12346241 or equivalent)
Power Steering System	GM Power Steering Fluid (GM P/N 1052884 - 1 pint or 1050017 - 1 quart, or equivalent)
Weatherstrip Conditioning	Dielectric Silicone Grease (GM P/N 12345579 or equivalent)
Windshield Washer Solvent	GM Optikleen ® Washer Solvent (GM Part No. 1051515) or equivalent.

# **Descriptions and Operations**

# **Power Steering System Description**

# **Power Steering Pump Description**

The power steering pump is a vane-type pump which provides hydraulic pressure for the system. The power steering system consists of the following components:

- The driveshaft
- The pump housing
- The pump ring
- The pressure plate
- The thrust plate
- The flow control valve
- The rotor
- The vanes

The opening at the rear of the pump housing contains the following components:

- The pump ring
- The pressure plate
- The thrust plate
- The rotor
- The vanes
- The end plate

The small opening on the side of the housing contains the following components:

- The pressure line fitting
- The flow control valve
- The spring

The flow control orifice is a component of the pressure line fitting. A pressure relief valve inside the flow control valve limits the pump pressure.

# **Power Steering Gear Description**

The movement of the steering wheel has the following results:

- 1. The movement of the steering wheel transfers to the pinion.
- 2. The movement of the pinion transfers through the pinion teeth.
- 3. The pinion teeth mesh with the teeth on the rack.
- 4. This action causes the rack to move.

The power rack and pinion steering system has a rotary control valve. The rotary control valve directs the hydraulic fluid that flows from the hydraulic pump to either side of the rack piston.

The integral pick piston attaches to the rack.

The integral rack piston has the following effects:

- 1. The rack piston converts hydraulic pressure to linear force.
- 2. The linear force moves the rack left or right.
- 3. The linear force transmits to the inner and outer tie rods to the steering knuckles.
- 4. The steering knuckles turn the wheels.

The system will require more steering effort if hydraulic assist is not available. If hydraulic assist is not available, the system will maintain manual control.

# Steering Wheel and Column - Standard Description and Operation

The steering wheel and column has 4 primary functions:

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

# **Vehicle Steering**

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

# **Vehicle Security**

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch
- The steering column lock
- The ignition cylinder

### **Driver Convenience**

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on or near the steering wheel or column.

- The turn signal switch
- The hazard switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad/cruise control switch
- The redundant radio/entertainment system controls
- The tilt or tilt/telescoping functions
- The HVAC controls

# **Driver Safety**

The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The mounting capsules break away from the mounting bracket in the event of an accident.

# Suspension Description and Operation

# **Front Suspension**

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension allows each wheel to compensate for changes in the road surface without affecting the opposite wheel. Each wheel independently connects to the frame with a steering knuckle, ball joint assemblies, and upper and lower control arms.

The control specifically allow the steering knuckles to move in a three-dimensional arc. Two tie rods connect to steering arms on the knuckles and an intermediate rod. These operate the front wheels.

A spring stabilizer shaft controls the side roll of the front suspension. This shaft is mounted in rubber insulators that are held by brackets to the frame side rails. The ends of the stabilizer shaft connect to the lower control arms with link bolts. Rubber insulators isolate these link bolts.

A ball joint assembly is riveted and bolted to the outer end of the upper control arm. A castellated nut and a cotter pin join the steering knuckle to the upper ball joint.

The inner ends of the lower control arm have pressed-in bushings. The bolts pass through the bushings and join the arm to the frame. The lower ball joint assembly is a press fit in the lower control arm and attaches to the steering knuckle with a castellated nut and a cotter pin.

Ball socket assemblies have rubber grease seals. These seals prevent entry of moisture and dirt, and these seals prevent damage to the bearing surfaces.

### **Rear Suspension**

The rear suspension uses coil springs (2) over struts (1), and lightweight aluminum knuckles. Each wheel is mounted to a tri-link independent suspension system. The three links are identified as the inverted U channel trailing arm and the stamped front and rear lateral links (7).

Parallel links allow the rear wheels to deflect rearward when they hit a road hazard, but without moving the toe positive. This suspension system reduces unsprung and overall weight. Handling is improved with the independent action of each rear wheel. The links control lateral wheel deflection.

Several techniques have been employed in order to achieve this independent wheel movement. The trilink design can be compared to a right angle. The wheel is located at the right angle formed by the lateral links and the trailing arm. The ends of the tri-links are hinged in order to provide vertical wheel travel. The solid links force the wheel to travel through a controlled arc. In this arc the fore-aft position is determined by the trailing arm and the lateral position is determined by the lateral links.

### **Knuckle Description**

The knuckle is a machined aluminum casting. Do not use a hammer in order to loosen suspension components attached to the knuckle. Do not pry or hammer on the aluminum knuckle in any way. Following these instructions will avoid damage to parts and systems.

### 2001 Chevrolet Malibu Restoration Kit

The suspension performs the following functions:

- Maintaining geometric wheel location
- The knuckle supports the brake drum
- All brake torque and braking forces are transmitted through the tri-links and the strut
- The links maintain the camber angle of the wheel throughout the wheels travel

The links allow for setting toe. The overall result of this rear suspension geometry is to maintain the rear wheels in a near vertical position at all times.

# **Stabilizer Shaft Description**

The stabilizer shaft is attached to the stabilizer link and extends forward. The stabilizer shaft is then connected to the rear suspension support by two rubber bushings and mounting brackets.

## **Hub and Bearing Description**

A non-serviceable unit hub and bearing is bolted to the knuckle. This hub and bearing is a sealed, maintenance free unit.

### **Struts Description**

The suspension system should be periodically inspected for the following conditions:

- Shock absorbency
- Bushing durability
- Tightness of attaching bolts
- Any visible damage
- Misalignment
- Excessive wear

#### Wheels and Tires

### **General Description**

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

The following factors have an important influence on tire life:

- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

## **Tread Wear Indicators Description**

The original equipment tires have tread wear indicators that show when you should replace the tires.

The location of these indicators are at 72 degree intervals around the outer diameter of the tire. The indicators appear as a 6 mm (0.25 in) wide band when the tire tread depth becomes 1.6 mm (2/32 in).

# **Metric Wheel Nuts and Bolts Description**

Metric wheel/nuts and bolts are identified in the following way:

- The wheel/nut has the word Metric stamped on the face.
- The letter M is stamped on the end of the wheel bolt.

The thread sizes of metric wheel/nuts and the bolts are indicated by the following example: M12 x 1.5.

- M = Metric
- 12 = Diameter in millimeters
- 1.5 = Millimeters gap per thread

### **Tire Inflation Description**

When you inflate the tires to the recommended inflation pressures, the factory-installed wheels and tires are designed in order to handle loads to the tire's rated load capacity. Incorrect tire pressures, or underinflated tires, can cause the following conditions:

- Vehicle handling concerns
- Poor fuel economy
- Shortened tire life
- Tire overloading

Inspect the tire pressure when the following conditions apply:

- The vehicle has been sitting at least 3 hours.
- The vehicle has not been driven for more than 1.6 km (1 mi).
- The tires are cool.

Inspect the tires monthly or before any extended trip. Adjust the tire pressure to the specifications on the tire label. Install the valve caps or the extensions on the valves. The caps or the extensions keep out dust and water.

The kilopascal (kPa) is the metric term for pressure. The tire pressure may be printed in both kilopascal (kPa) and psi. One psi equals 6.9 kPa.

### Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
	Conversion: (	6.9 kPa = 1 psi	

Tires with a higher than recommended pressure can cause the following conditions:

- A hard ride
- Tire bruising
- Rapid tread wear at the center of the tire

Tires with a lower than recommended pressure can cause the following conditions:

- A tire squeal on turns
- Hard steering
- Rapid wear and uneven wear on the edge of the tread
- Tire rim bruises and tire rim rupture
- Tire cord breakage
- High tire temperatures
- Reduced vehicle handling
- High fuel consumption
- Soft riding

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking
- Steering lead
- Reduced vehicle handling

### **P-Metric Sized Tires Description**

Most P-metric tire sizes do not have exact corresponding alphanumeric tire sizes. Replacement tires should be of the same tire performance criteria (TPC) specification number including the same size, the same load range, and the same construction as those originally installed on the vehicle. Consult a tire dealer if you must replace the P-metric tire with other sizes. Tire companies can best recommend the closest match of alphanumeric to P-metric sizes within their own tire lines.

# **Driveline System Description and Operation**

#### Wheel Drive Shafts

Front wheel drive axles are flexible assemblies.

Front wheel drive axles consist of the following components:

- A front wheel drive shaft tri-pot joint (inner joint)
- A front wheel drive shaft constant velocity joint (outer joint)
- A front wheel drive shaft The front wheel drive shaft connects the front wheel drive shaft tri-pot
  joint and the front wheel drive shaft constant velocity joint.

The front wheel drive shaft tri-pot joint is completely flexible. The front wheel drive shaft tri-pot joint can move in and out.

The front wheel drive shaft constant velocity joint is flexible, but the front wheel drive shaft constant velocity joint cannot move in and out.

### **Boots (Seals) And Clamps**

The front wheel drive shaft constant velocity joint and the front wheel drive shaft tri-pot joint boots (seals) in the front wheel drive axle are made of a thermoplastic material.

The clamps in front wheel drive axle are made of stainless steel.

The boot (seal) provides the following functions:

- Protection of the internal parts of the front wheel drive shaft constant velocity joint and the front wheel drive shaft tri-pot joint. The boot (seal) protects the grease from the following sources of damage:
  - Harmful atmospheric conditions (such as extreme temperatures or ozone gas)
  - Foreign material (such as dirt or water)
- Allows angular movement and the axial movement of the front wheel drive shaft tri-pot joint.
- Allows angular movement of the front wheel drive shaft constant velocity joint.

## **Important**

Protect the boots (seals) from sharp tools and from the sharp edges of the surrounding components.

Any damage to the boots (seals) or the clamps will result in leakage. Leakage will allow water to leak into the front wheel drive shaft tri-pot joints. Leakage will also allow grease to leak out of the front wheel drive shaft tri-pot joints and the front wheel drive shaft constant velocity joints.

Leakage may cause noisy front wheel drive axle operation and eventual failure of the internal components.

The clamps provide a leak proof connection for the front wheel drive shaft tri-pot joint and the front wheel drive shaft constant velocity joint at the following locations:

- The housing
- The front wheel drive shaft

The thermoplastic material performs well under normal conditions and normal operation. However, the material is not strong enough to withstand the following conditions:

- Abusive handling
- Damage from sharp objects (such as sharp tools or any sharp edges of the surrounding components in the vehicle).

# Front Wheel Drive Shaft Tri-pot Joint (Inner Joint)

The front wheel drive shaft tri-pot joint is made with the tri-pot design without an over-extension limitation retainer.

The joint is constructed as follows for vehicles that are equipped with an automatic transmission:

- The left front wheel drive axle has a female spline. The female spline installs over a stub shaft that protrudes from the transaxle.
- The right front wheel drive axle has a male spline. The right front wheel drive axle uses barrel type snap rings in order to interlock with the transaxle gears.

# Front Wheel Drive Shaft Constant Velocity Joint (Outer Joint)

The front wheel drive shaft constant velocity joint is made with the Rzeppa joint design.

The shaft end (which mates with the knuckle/hub) has a helical spline. The helical spline ensures a tight, press-type fit.

This design prevents end play between the hub bearing and the front wheel drive axle.

# **Braking System Description and Operation**

# **Hydraulic Brake System Description and Operation**

## **System Component Description**

The hydraulic brake system consists of the following:

## Hydraulic Brake Master Cylinder Fluid Reservoir

Contains supply of brake fluid for the hydraulic brake system.

# **Hydraulic Brake Master Cylinder**

Converts mechanical input force into hydraulic output pressure.

Hydraulic output pressure is distributed from the master cylinder through two hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

# **Hydraulic Brake Pressure Balance Control System**

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force.

Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator.

# **Hydraulic Brake Pipes and Flexible Brake Hoses**

Carries brake fluid to and from hydraulic brake system components.

# **Hydraulic Brake Wheel Apply Components**

Converts hydraulic input pressure into mechanical output force.

#### **System Operation**

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

# **Brake Assist System Description and Operation**

## **System Component Description**

The brake assist system consists of the following:

#### **Brake Pedal**

Receives, multiplies and transfers brake system input force from driver.

#### **Brake Pedal Pushrod**

Transfers multiplied input force received from brake pedal to brake booster.

#### Vacuum Brake Booster

Uses source vacuum to decrease effort required by driver when applying brake system input force.

When brake system input force is applied, air at atmospheric pressure is admitted to the rear of both vacuum diaphragms, providing a decrease in brake pedal effort required. When input force is removed, vacuum replaces atmospheric pressure within the booster.

#### **Vacuum Source**

Supplies force used by vacuum brake booster to decrease brake pedal effort.

### **Vacuum Source Delivery System**

Enables delivery and retention of source vacuum for vacuum brake booster.

### System Operation

Brake system input force is multiplied by the brake pedal and transferred by the pedal pushrod to the hydraulic brake master cylinder. Effort required to apply the brake system is reduced by the vacuum brake booster.

# **Disc Brake System Description and Operation**

#### **System Component Description**

The disc brake system consists of the following components:

#### **Disc Brake Pads**

Applies mechanical output force from the hydraulic brake calipers to friction surfaces of brake rotors.

## **Disc Brake Rotors**

Uses mechanical output force applied to friction surfaces from the disc brake pads to slow speed of tire and wheel assembly rotation.

## **Disc Brake Pad Hardware**

Secures disc brake pads firmly in proper relationship to the hydraulic brake calipers. Enables a sliding motion of brake pads when mechanical output force is applied.

# **Disc Brake Caliper Hardware**

Provides mounting for hydraulic brake caliper and secures the caliper firmly in proper relationship to caliper bracket. Enables a sliding motion of the brake caliper to the brake pads when mechanical output force is applied.

### **System Operation**

Mechanical output force is applied from the hydraulic brake caliper pistons to the inner brake pads. As the pistons press the inner brake pads outward, the caliper housings draw the outer brake pads inward. This allows the output force to be equally distributed. The brake pads apply the output force to the friction surfaces on both sides of the brake rotors, which slows the rotation of the tire and wheel assemblies. The correct function of both the brake pad and brake caliper hardware is essential for even distribution of braking force.

# **Drum Brake System Description and Operation**

#### **System Component Description**

The drum brake system consists of the following:

#### **Drum Brake Shoes**

Applies mechanical output force (from hydraulic brake wheel cylinders) to friction surface of brake drums.

#### **Brake Drums**

Uses mechanical output force applied to friction surface from drum brake shoes to slow speed of tire and wheel assembly rotation.

#### **Drum Brake Hardware**

Secures drum brake shoes firmly in proper relationship to hydraulic brake wheel cylinders. Enables sliding motion of brake shoes needed to expand toward friction surface of drums when mechanical output force is applied; provides return of brake shoes when mechanical output force is relieved.

#### **Drum Brake Adjusting Hardware**

Provides automatic adjustment of brake shoes to brake drum friction surface whenever brake apply occurs during rearward motion of the vehicle.

#### **System Operation**

Mechanical output force is applied from the hydraulic brake wheel cylinder pistons to the top of the drum brake shoes. The output force is then distributed between the primary and secondary brake shoes as the shoes expand toward the friction surface of the brake drums. The brake shoes apply the output force to the friction surface of the brake drums, which slows the rotation of the tire and wheel assemblies. The proper function of both the drum brake hardware and adjusting hardware is essential to the proper distribution of braking force.

# Park Brake System Description and Operation

#### **System Component Description**

The park brake system consists of the following:

### Park Brake Lever Assembly

Receives, multiplies, and transfers park brake system apply input force from operator to park brake cable system.

Releases applied park brake system when lever is returned to at-rest, lowered, position.

#### Park Brake Cables

Transfers input force received from park brake lever, through park brake cable equalizer, to park brake apply levers.

### Park Brake Cable Equalizer

Evenly distributes input force to both the left and right park brake units.

### Park Brake Apply Lever

Multiplies and transfers input force to park brake actuator/adjuster.

## Park Brake Actuator/Adjuster

Uses multiplied input force from apply lever to expand drum brake shoes toward the friction surface of the brake drum.

Threaded park brake actuators/adjusters are also used to control clearance between the drum brake shoes and the friction surface of the brake drum.

### **Drum Brake Shoes**

Applies mechanical output force from park brake actuator/adjuster to friction surface of the brake drum.

#### System Operation

Park brake apply input force is received by the park brake lever assembly being applied. The input force is multiplied by the lever assembly, transferred, and evenly distributed, through the park brake cables and the park brake cable equalizer, to the left and right park brake apply levers. The park brake apply levers multiply and transfer the apply input force to the park brake actuators/adjusters which expand the drum brake shoes toward the friction surface of the brake drum in order to prevent the rotation of the rear tire and wheel assemblies. The park brake lever assembly releases an applied park brake system when it is returned to the at-rest, lowered, position.

# **ABS Description and Operation**

### **Antilock Brake System**

When wheel slip is detected during a brake application, the ABS enters antilock mode. During antilock braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel brake. The ABS cannot, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking.

During antilock braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the EBCM responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during antilock braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During antilock braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during antilock operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non-ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability.

# **Engine Component Description**

The cylinder block is made of cast alloy iron and has six cylinders arranged in a V shape with three cylinders in each bank. The cylinder banks are set at a 60 degree angle from each other.

The right bank cylinders are 1,3,5 and the left bank cylinders are 2,4,6 starting from the front of the engine.

Four main bearings support the crankshaft which is retained by bearing caps that are machined with the block for proper alignment and clearances. The main bearing caps are also drilled and tapped for the structural oil pan side bolts.

The aluminum cylinder heads have individual intake and exhaust ports for each cylinder. Valve guides and valve seats are pressed in, and roller rocker arms are located on a pedestal in a slot in the cylinder head and are retained on individual threaded bolts.

The crankshaft is cast nodular iron with deep rolled fillets on all six crankpins and all four main journals. Four steel-backed aluminum bearings are used, with the #3 bearing being the end-thrust bearing.

The camshaft is made from a new metal composite design. The camshaft profile is a hydraulic roller design. The camshaft is supported by four journals and includes an oil pump drive gear.

The pistons are cast aluminum using two low tension compression rings and one oil control ring. The piston pin is offset 0.8 mm (0.031 in) towards the major thrust side. This allows a gradual change in thrust pressure against the cylinder wall as the piston travels its path. Pins are chromium steel and have a floating fit in the pistons. They are retained in the connecting rods by a press fit.

Connecting rods are made of forged steel. Full pressure lubrication is directed to the connecting rods by drilled oil passages from the adjacent main bearing journal.

A roller rocker type valve train is used. Motion is transmitted from the camshaft through the hydraulic roller lifter and the pushrod to the roller rocker arm. The rocker arm pivots on needle roller bearings and transmits the camshaft motion to the valve. The rocker arm pedestal locates in a slot in the cylinder head and the rocker arm is retained in the cylinder head by a bolt. The pushrod is located by the rocker arm.

The intake manifold is a two-piece cast aluminum unit. It centrally supports a fuel rail with six fuel injectors.

The exhaust manifolds are cast nodular iron.

#### Lubrication

Full pressure lubrication, through a full flow oil filter, is furnished by a gear type oil pump. The oil is drawn up through the pickup screen and the tube. The oil passes through the pump to the oil filter.

The oil filter is a full flow paper element unit. An oil filter bypass is used in order to ensure oil supply during the following conditions:

- On a cold start
- If the filter is plugged
- If the filter develops excessive pressure drop

The bypass is designed to open at 69-83 kPa (10-12 psi).

A new priority oil delivery system supplies oil first to the crankshaft journals. The oil from the crankshaft main bearings is supplied to the connecting rod bearings by intersecting the passages drilled in the crankshaft. The passages supply the oil to the crankshaft main bearings and the camshaft bearings through the intersecting vertical drilled holes. The oil passages from the camshaft journals supply oil to the hydraulic lifters.

The hydraulic lifters pump oil up through the pushrods to the rocker arms. The cast dams in the crankcase casting direct the oil that drains back from the rocker arms in order to supply the camshaft lobes. The camshaft chain drive is lubricated by indirect oil splash.

### **Drive Belt System Description**

The drive belt system consists of the following components:

- The drive belt
- The drive belt tensioner
- The drive belt idler pulley
- The crankshaft balancer pulley
- The accessory drive component mounting brackets
- The accessory drive components
  - The power steering pump, if belt driven
  - The generator
  - The A/C compressor, if equipped
  - The engine cooling fan, if belt driven
  - The water pump, if belt driven
  - The vacuum pump, if equipped
  - The air compressor, if equipped

The drive belt system may use one belt or two belts. The drive belt is thin so that it can bend backwards and has several ribs to match the grooves in the pulleys. There also may be a V-belt style belt used to drive certain accessory drive components. The drive belts are made of different types of rubbers (chloroprene or EPDM) and have different layers or plys containing either fiber cloth or cords for reinforcement.

Both sides of the drive belt may be used to drive the different accessory drive components. When the back side of the drive belt is used to drive a pulley, the pulley is smooth.

The drive belt is pulled by the crankshaft balancer pulley across the accessory drive component pulleys. The spring loaded drive belt tensioner keeps constant tension on the drive belt to prevent the drive belt from slipping. The drive belt tensioner arm will move when loads are applied to the drive belt by the accessory drive components and the crankshaft.

The drive belt system may have an idler pulley, which is used to add wrap to the adjacent pulleys. Some systems use an idler pulley in place of an accessory drive component when the vehicle is not equipped with the accessory.

# **Cooling System Description and Operation**

#### **Coolant Heater**

The optional engine coolant heater (RPO K05) operates using 110-volt AC external power and is designed to warm the coolant in the engine block area for improved starting in very cold weather -29°C (-20°F). The coolant heater helps reduce fuel consumption when a cold engine is warming up. The unit is equipped with a detachable AC power cord. A weather shield on the cord is provided to protect the plug when not in use.

### **Cooling System**

The cooling system's function is to maintain an efficient engine operating temperature during all engine speeds and operating conditions. The cooling system is designed to remove approximately one-third of the heat produced by the burning of the air-fuel mixture. When the engine is cold, the coolant does not flow to the radiator until the thermostat opens. This allows the engine to warm quickly.

#### **Cooling Cycle**

Coolant flows from the radiator outlet and into the water pump inlet. Some coolant flows from the water pump, to the heater core, then back to the water pump. This provides the passenger compartment with heat and defrost capability as the coolant warms up.

Coolant also flows from the water pump outlet and into the engine block. In the engine block, the coolant circulates through the water jackets surrounding the cylinders where it absorbs heat.

The coolant then flows through the cylinder head gasket openings and into the cylinder heads. In the cylinder heads, the coolant flows through the water jackets surrounding the combustion chambers and valve seats, where it absorbs additional heat.

From the cylinder heads, the coolant flows to the thermostat. The flow of coolant will either be stopped at the thermostat until the engine reaches normal operating temperature, or it will flow through the thermostat and into the radiator where it is cooled. At this point, the coolant flow cycle is completed.

Efficient operation of the cooling system requires proper functioning of all cooling system components. The cooling system consists of the following components:

#### Coolant

The engine coolant is a solution made up of a 50-50 mixture of DEX-COOL and suitable drinking water. The coolant solution carries excess heat away from the engine to the radiator, where the heat is dissipated to the atmosphere.

#### Radiator

The radiator is a heat exchanger. It consists of a core and two tanks. The aluminum core is a tube and fin crossflow design that extends from the inlet tank to the outlet tank. Fins are placed around the outside of the tubes to improve heat transfer to the atmosphere.

The inlet and outlet tanks are a molded, high temperature, nylon reinforced plastic material. A high temperature rubber gasket seals the tank flange edge to the aluminum core. The tanks are clamped to the core with clinch tabs. The tabs are part of the aluminum header at each end of the core.

The radiator also has a drain cock located in the bottom of the left hand tank. The drain cock unit includes the drain cock and drain cock seal.

The radiator removes heat from the coolant passing through it. The fins on the core transfer heat from the coolant passing through the tubes. As air passes between the fins, it absorbs heat and cools the coolant.

### **Pressure Cap**

The pressure cap seals the cooling system. It contains a blow off or pressure valve and a vacuum or atmospheric valve. The pressure valve is held against its seat by a spring, which protects the radiator from excessive cooling system pressure. The vacuum valve is held against its seat by a spring, which permits opening of the valve to relieve vacuum created in the cooling system as it cools off. The vacuum, if not relieved, might cause the radiator and/or coolant hoses to collapse.

The pressure cap allows cooling system pressure to build up as the temperature increases. As the pressure builds, the boiling point of the coolant increases. Engine coolant can be safely run at a temperature much higher than the boiling point of the coolant at atmospheric pressure. The hotter the coolant is, the faster the heat transfers from the radiator to the cooler, passing air.

The pressure in the cooling system can get too high. When the cooling system pressure exceeds the rating of the pressure cap, it raises the pressure valve, venting the excess pressure.

As the engine cools down, the temperature of the coolant drops and a vacuum is created in the cooling system. This vacuum causes the vacuum valve to open, allowing outside air into the surge tank. This equalizes the pressure in the cooling system with atmospheric pressure, preventing the radiator and coolant hoses from collapsing.

### **Coolant Recovery System**

The coolant recovery system consists of a plastic coolant recovery reservoir and overflow tube. The recovery reservoir is also called a recovery tank or expansion tank. It is partially filled with coolant and is connected to the radiator fill neck with the overflow tube. Coolant can flow back and forth between the radiator and the reservoir.

In effect, a cooling system with a coolant recovery reservoir is a closed system. When the pressure in the cooling system gets too high, it will open the pressure valve in the pressure cap. This allows the coolant, which has expanded due to being heated, is allowed to flow through the overflow tube and into the recovery reservoir. As the engine cools down, the temperature of the coolant drops and a vacuum is created in the cooling system. This vacuum opens the vacuum valve in the pressure cap, allowing some of the coolant in the reservoir to be siphoned back into the radiator. Under normal operating conditions, no coolant is lost. Although the coolant level in the recovery reservoir goes up and down, the radiator and

cooling system are kept full. An advantage to using a coolant recovery reservoir is that it eliminates almost all air bubbles from the cooling system. Coolant without bubbles absorbs heat much better than coolant with bubbles.

### Air Baffles and Seals

The cooling system uses deflectors, air baffles and air seals to increase cooling system capability. Deflectors are installed under the vehicle to redirect airflow beneath the vehicle and through the radiator to increase engine cooling. Air baffles are also used to direct airflow through the radiator and increase cooling capability. Air seals prevent air from bypassing the radiator and A/C condenser, and prevent recirculation of hot air for better hot weather cooling and A/C condenser performance.

### **Water Pump**

The water pump is a centrifugal vane impeller type pump. The pump consists of a housing with coolant inlet and outlet passages and an impeller. The impeller is mounted on the pump shaft and consists of a series of flat or curved blades or vanes on a flat plate. When the impeller rotates, the coolant between the vanes is thrown outward by centrifugal force.

The impeller shaft is supported by one or more sealed bearings. The sealed bearings never need to be lubricated. Grease cannot leak out, dirt and water cannot get in as long as the seal is not damaged or worn.

The purpose of the water pump is to circulate coolant throughout the cooling system. The water pump is driven by the crankshaft via the drive belt.

#### **Thermostat**

The thermostat is a coolant flow control component. It's purpose is to help regulate the operating temperature of the engine. It utilizes a temperature sensitive wax-pellet element. The element connects to a valve through a small piston. When the element is heated, it expands and exerts pressure against the small piston. This pressure forces the valve to open. As the element is cooled, it contracts. This contraction allows a spring to push the valve closed.

When the coolant temperature is below the rated thermostat opening temperature, the thermostat valve remains closed. This prevents circulation of the coolant to the radiator and allows the engine to warm up. After the coolant temperature reaches the rated thermostat opening temperature, the thermostat valve will open. The coolant is then allowed to circulate through the thermostat to the radiator where the engine heat is dissipated to the atmosphere. The thermostat also provides a restriction in the cooling system, after it has opened. This restriction creates a pressure difference which prevents cavitation at the water pump and forces coolant to circulate through the engine block.

#### **Engine Oil Cooler**

The engine oil cooler is a heat exchanger. It is located inside the left side end tank of the radiator. The engine oil temperature is controlled by the temperature of the engine coolant that surrounds the oil cooler in the radiator.

The engine oil pump, pumps the oil through the engine oil cooler line to the oil cooler. The oil then flows through the cooler where the engine coolant absorbs heat from the oil. The oil is then pumped through the oil cooler return line, to the oil filter, to the engine block oil system.

### Transmission Oil Cooler

The transmission oil cooler is a heat exchanger. It is located inside the right side end tank of the radiator. The transmission fluid temperature is regulated by the temperature of the engine coolant in the radiator.

The transmission oil pump, pumps the fluid through the transmission oil cooler line to the transmission oil cooler. The fluid then flows through the cooler where the engine coolant absorbs heat from the fluid. The fluid is then pumped through the transmission oil cooler return line, to the transmission.

# **Battery Description and Operation**

#### Caution

Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.
- Follow each step of the jump starting procedure in order.
- Treat both the booster and the discharged batteries carefully when using the jumper cables.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for two small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

The battery has three functions as a major source of energy:

- Engine cranking
- Voltage stabilizer
- Alternate source of energy with generator overload.

## 2001 Chevrolet Malibu Restoration Kit

The battery specification label (example below) contains information about the following:

- The test ratings
- The original equipment catalog number
- The recommended replacement model number

1819

CCA LOAD TEST
770 380

REPLACEMENT MODEL
100 – 6YR

## A battery has 2 ratings:

- Reserve capacity
- Cold cranking amperage

When a battery is replaced use a battery with similar ratings. Refer to the battery specification label on the original battery or refer to Battery Usage .

# **Reserve Capacity**

Reserve capacity is the amount of time in minutes it takes a fully charged battery, being discharged at a constant rate of 25 amperes and a constant temperature of 27°C (80°F) to reach a terminal voltage of 10.5 V. Refer to Battery Usage for the reserve capacity rating of the original equipment battery.

### **Cold Cranking Amperage**

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18°C (0°F) while maintaining at least 7.2 volts. Refer to Battery Usage for the cold cranking amperage rating for this vehicle.

# **Circuit Description**

The battery positive terminal supplies Battery Positive voltage to the under hood fuse block and the rear fuse block. The under hood fuse block provides a cable connection for the generator and a cable connection for the starter.

The battery negative terminal is connected to chassis ground G305 and supplies ground for the AD converter in the DIM.

# **Starting System Description and Operation**

The cranking circuit consists of the battery, starter motor, ignition switch, and related wiring.

These starter motors are not serviceable and are replaced as assemblies only.

The [PG] starter motors are [non-]repairable starter motors. They have pole pieces that are arranged around the armature within the starter housing. When the solenoid windings are energized, the pull-in

winding circuit is completed to ground through the starter motor. The hold-in winding circuit is completed to ground through the solenoid. The windings work together magnetically to pull in and hold in the plunger. The plunger moves the shift lever. This action causes the starter drive assembly to rotate on the armature shaft spline as it engages with the flywheel ring gear on the engine. At the same time, the plunger closes the solenoid switch contacts in the starter solenoid. Full battery voltage is then applied directly to the starter motor and it cranks the engine.

As soon as the solenoid switch contacts close, current stops flowing thorough the pull-in winding as battery voltage is now applied to both ends of the windings. The hold-in winding remains energized; its magnetic field is strong enough to hold the plunger, shift lever, starter drive assembly, and solenoid switch contacts in place to continue cranking the engine. When the engine starts, the pinion gear overrun protects the armature from excessive speed until the switch is opened.

When the ignition switch is released from the START position, crank voltage is removed from the starter solenoid S terminal. Current flows from the motor contacts through both windings to ground at the end of the hold-in winding. However, the direction of the current flow through the pull-in winding is now in the opposite direction of the current flow when the winding was first energized.

The magnetic fields of the pull-in and hold-in windings now oppose one another. This action of the windings, along with the help of the return spring, cause the starter drive assembly to disengage and the solenoid switch contacts to open simultaneously. As soon as the contacts open, the starter motor is turned off.

# **Charging System Description and Operation**

#### Generator

The generator is non-repairable. The generator(s) feature the following major components:

- The delta stator
- The rectifier bridge
- The rotor with slip rings and brushes
- A conventional pulley
- Dual internal fans
- The regulator

The pulley and the fan cool the slip ring and the frame.

The generator features permanently lubricated bearings. Service should only include the tightening of mounting components. Otherwise, the generator is replaced as a complete unit.

#### Regulator

The voltage regulator controls the field current of the rotor in order to limit system voltage. The regulator switches the current on and off at a rate of 400 cycles per second in order to perform the following functions:

- Radio noise control
- Obtain the correct average current needed for proper system voltage control

At high speeds, the on-time may be 10 percent with the off-time at 90 percent. At low speeds, the on-time may be 90 percent and the off-time 10 percent.

# **Fuel System Specifications**

Use regular unleaded gasoline rated at 87 octane or higher. It is recommended that the gasoline meet specifications which have been developed by the American Automobile Manufacturers Association (AAMA) and endorsed by the Canadian Motor Vehicle Manufacturers Association for better vehicle performance and engine protection. Gasoline meeting the AAMA specification could provide improved driveability and emission control system performance compared to other gasolines. For more information, write to: American Automobile Manufacturer's Association, 7430 Second Ave., Suite 300, Detroit MI 48202.

Be sure the posted octane is at least 87. If the octane is less than 87, you may get a heavy knocking noise when you drive. If it is bad enough, it can damage your engine.

If you're using fuel rated at 87 octane or higher and you hear heavy knocking, your engine needs service. But don't worry if you hear a little pinging noise when you're accelerating or driving up a hill. That's

normal, and you don't have to buy a higher octane fuel to get rid of pinging. It's the heavy, constant knock that means you have a problem.

#### **Notice**

Your vehicle was not designed for fuel that contains methanol. Do not use methanol fuel which can corrode metal parts in your fuel system and also damage plastic and rubber parts. This kind of damage would not be covered under your warranty.

If your vehicle is certified to meet to meet California Emission Standards, indicated on the under hood emission control label, it is designed to operate on fuels that meet California specifications. If such fuels are not available in states adopting California emissions standards, your vehicle will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be affected. The malfunction indicator lamp on your instrument panel may turn on and/or your vehicle may fail a smogcheck test. If this occurs, return to your authorized dealer for diagnosis to determine the cause of failure. In the event it is determined that the cause of the condition is the type of fuels used, repairs may not be covered by your warranty.

Some gasolines that are not reformulated for low emissions may contain an octane-enhancing additive called methylcyclopentadienyl manganese tricarbonyl (MMT). Ask your service station operator whether or not the fuel contains MMT.

## **Exhaust System Description**

#### **Important**

Use of non-OEM parts may cause driveability concerns.

#### **General Description**

The exhaust system is used to carry and treat the gases that are created by the engine. When the engine exhaust valve opens hot gases created by the engine combustion cycle are allowed to travel out through the cylinder head into the exhaust manifold. In the exhaust manifold the exhaust gases combine with exhaust gases from the other cylinders and pass through a flanged port into the three-way catalytic converter pipe. The exhaust gases pass through the catalytic converter to reduce pollutants from the exhaust stream gases. The three-way catalytic converter pipe carries the exhaust gases on to the exhaust system where the resonator and muffler are used to reduce the noise levels of the exhaust. The exhaust system exits at the rear of the vehicle to reduce exhaust noise and prevent fumes from entering the vehicle. Exhaust system hangers and insulators support the weight of the exhaust system, isolate engine noise, isolate engine vibration, space the system away from the underbody of the vehicle and allow for exhaust system expansion that occurs as the exhaust system warms up.

#### **Exhaust Manifold**

The exhaust manifold is a component of the exhaust system used to collect and carry hot exhaust gases away from the engine. Made from cast iron, the exhaust manifold combines the exhaust gases from several cylinders. The exhaust manifold is bolted to the cylinder head with a exhaust manifold gasket between them. The left (front) exhaust manifold connects to a crossover pipe that is part of the right (rear) exhaust manifold and carries the exhaust gases from the front of the vehicle over the transmission to the right (rear) exhaust manifold. The gases are combined in the right (rear) manifold and directed on to the three-way catalytic converter. The three-way catalytic converter pipe and gasket are bolted to the right (rear) exhaust manifold. The right (rear) exhaust manifold has two tapped holes. The heated oxygen sensor (HO2S) threads into the hole by the flange and the EGR valve pipe threads into the hole where the crossover meets the right (rear) exhaust manifold.

### Resonator

Some exhaust systems are equipped with a resonator. The resonator, located either before or after the muffler, allows the use of mufflers with less back pressure. Resonators are used when vehicle characteristics require specific exhaust tuning.

### **Catalytic Converter**

The catalytic converter is an emission control device added to the engine exhaust system in order to reduce hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) pollutants from the exhaust gas.

The catalytic converter is comprised of a ceramic monolith substrate, supported in insulation and housed within a sheet metal shell. The substrate may be washcoated with 3 noble metals:

- Platium (Pt)
- Palladium (Pd)
- Rhodium (Rh)

The catalyst in the converter is not serviceable.

# **Exhaust Pipe Description**

The exhaust pipe carries exhaust gases treated by the three-way catalytic converter through a resonator and into the exhaust muffler. As exhaust gases travel through the resonator and muffler baffles, exhaust noise is lessened. The exhaust system exits at the rear of the vehicle to reduce exhaust noise and eliminate fumes from entry into the vehicle. Exhaust system hangers and insulators support the weight of the exhaust pipe, the resonator, and the muffler. The exhaust system hangers also space the exhaust system away from the underbody of the vehicle and allow the exhaust system to expand as the exhaust system warms up.

#### Muffler

The exhaust muffler reduces the noise levels of the engine exhaust by the use of tuning tubes. The tuning tubes create channels inside the exhaust muffler that lower the sound levels created by the combustion of the engine.

# **Transmission Component and System Description**

### **Transmission General Description**

The 4T40-E is a fully automatic front wheel drive electronically controlled transmission. The 4T40-E provides four forward ranges including overdrive and one reverse gear range. The PCM controls shift points by means of two shift solenoids. A vane type pump supplies the oil pressure. The PCM regulates oil pressure by means of the Pressure Control Solenoid (PCS).

You can operate the transmission in any one of the following seven modes:

- P -- Park position prevents the vehicle from rolling either forward or backward. For safety reasons, use the parking brake in addition to the park position.
- R -- Reverse allows the vehicle to be operated in a rearward direction.
- N -- Neutral allows the engine to be started and operated while driving the vehicle. If necessary, you may select this position in order to restart the engine with the vehicle moving.
- D -- Overdrive is used for all normal driving conditions. Overdrive provides four gear ratios plus a converter clutch operation. Depress the accelerator in order to downshift for safe passing.
- 3 -- Drive position is used for city traffic, hilly terrain, and trailer towing. Drive provides three gear ranges and prevents the transmission from operating in fourth gear. Depress the accelerator in order to downshift.
- 2 -- Manual Second provides two gear ratios under most operating conditions. Manual Second provides acceleration and engine braking. You may select this range at any vehicle speed, but you cannot downshift the transmission into Second gear until the vehicle speed drops below approximately 100 km/h (62 mph).
- 1 -- Manual Lo provides maximum engine braking. You may select this range at any vehicle speed, but you cannot downshift the transmission into First gear until the vehicle speed drops below approximately 60 km/h (37 mph).

#### Componants

The mechanical components of this unit are as follows:

- A torque converter with a torque converter clutch (TCC)
- A drive link assembly
- Intermediate/4th and Lo/Reverse friction band assemblies
- Forward, Coast, 2nd, Reverse, and Direct multiple disc clutch assemblies
- Two planetary gear sets: Input and Reaction
- Two roller clutches Lo and 2nd
- One sprag clutch
- One vane type oil pump
- One control valve assembly
- A final drive and differential assembly

The electrical components of this unit are as follows:

- Two shift solenoid valves, 1-2 and 2-3
- A torque converter clutch pulse width modulated (TCC PWM) solenoid valve
- A transmission pressure control (PC) solenoid valve
- An automatic transmission fluid temperature (TFT) sensor

- Two speed sensors: input and output speed sensor
- An automatic transmission fluid pressure (TFP) manual valve position switch assembly
- An automatic transmission wiring harness assembly
- A park/neutral position switch

# **Automatic Transmission Shift Lock Control Description**

The automatic transmission shift lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the shift lever out of the PARK position. The system consist of the following components:

- The automatic transmission shift lock control solenoid.
- The automatic transmission shift lock control switch.
- The park/neutral position switch.

With the ignition in the ON position, battery positive voltage is supplied to the park/neutral position switch. With the transmission in the PARK position the contacts in the park/neutral position switch are closed and voltage flows through the normally closed contacts of the automatic transmission shift lock control switch to the automatic transmission shift lock control solenoid. The automatic transmission shift lock control solenoid is permanently ground. This energizes the automatic transmission shift lock control solenoid and locks the shift lever in the PARK position. When the driver presses the brake pedal the contacts in the automatic transmission shift lock control switch open, de-energizing the automatic transmission shift lock control solenoid. This allows the shift lever to move out of the PARK position.

### **Fasteners**

### **Metric Fasteners**

This vehicle provides fastener dimensions using the metric system. Most metric fasteners are approximate in diameter to equivalent English fasteners. Make replacements using fasteners of the same nominal diameter, thread pitch, and strength.

A number marking identifies the OE metric fasteners except cross-recess head screws. The number also indicates the strength of the fastener material. A Posidrive® or Type 1A cross-recess identifies a metric cross-recess screw. For best results, use a Type 1A cross-recess screwdriver, or equivalent, in Posidrive® recess head screws.

GM Engineering Standards and North American Industries have adopted a portion of the ISO-defined standard metric fastener sizes. The purpose was to reduce the number of fastener sizes used while retaining the best thread qualities in each thread size. For example, the metric M6.0 X 1 screw, with nearly the same diameter and 25.4 threads per inch replaced the English 1/4-20 and 1/4-28 screws. The thread pitch is midway between the English coarse and fine thread pitches.

### **Fastener Strength Identification**

- 1. English Bolt, Grade 2 (Strength Class)
- English Bolt, Grade 5 (Strength Class)
- 3. English Bolt, Grade 7 (Strength Class)
- 4. English Bolt, Grade 8 (Strength Class)
- 5. Metric Nut, Strength Class 9
- 6. Metric Bolts, Strength Class Increases as Numbers Increase

The most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt. The English, inch strength classes range from grade 2 to grade 8. Radial lines are embossed on the head of each bolt in order to identify the strength class. The number of lines on the head of the bolt is 2 lines less than the actual grade. For example, a grade 8 bolt will have 6 radial lines on the bolt head. Some metric nuts are marked with a single digit strength identification number on the nut face.

The correct fasteners are available through GM SPO. Many metric fasteners available in the aftermarket parts channels are designed to metric standards of countries other than the United States, and may exhibit the following:

- Lower strength
- No numbered head marking system
- Wrong thread pitch

The metric fasteners on GM products are designed to new, international standards. The following are the common sizes and pitches, except for special applications:

- M6.0 X 1
- M8 X 1.25
- M10 X 1.5
- M12 X 1.75
- M14 X 2.00
- M16 X 2.00

### **Prevailing Torque Fasteners**

Prevailing torque fasteners create a thread interface between the fastener and the fastener counterpart in order to prevent the fastener from loosening.

### All Metal Prevailing Torque Fasteners

These fasteners accomplish the thread interface by a designed distortion or deformation in the fastener.

### **Nylon Interface Prevailing Torque Fasteners**

These fasteners accomplish the thread interface by the presence of a nylon material on the fastener threads.

### **Adhesive Coated Fasteners**

These fasteners accomplish the thread interface by the presence of a thread-locking compound on the fastener threads. Refer to the appropriate repair procedure in order to determine if the fastener may be reused and the applicable thread-locking compound to apply to the fastener.

- 1. Prevailing Torque Nut, Center Lock Type
- 2. Prevailing Torque Nut, Top Lock Type

- 3. Prevailing Torque Nut, Nylon Patch Type
- 4. Prevailing Torque Nut, Nylon Washer Insert Type
- 5. Prevailing Torque Nut, Nylon Insert Type
- 6. Prevailing Torque Bolt, Dry Adhesive Coating Type
- 7. Prevailing Torque Bolt, Thread Profile Deformed Type
- 8. Prevailing Torque Bolt, Nylon Strip Type
- 9. Prevailing Torque Bolt, Out-of-Round Thread Area Type

A prevailing torque fastener may be reused ONLY if:

- The fastener and the fastener counterpart are clean and not damaged
- There is no rust on the fastener
- The fastener develops the specified minimum torque against its counterpart prior to the fastener seating
